I can understand the operation of programs such as "mail" or "ed" due to the nature of teletypes, but isn't giving commands such terse names puishing it a bit? Still, it's faster to type even on the most modern of terminals.

ID>> A GUI doesn't necessarily mean a lot of processor

Not as efficient, but also a negligible overhead on a CPU running in tens of MHz.

If a GUI is inefficient, what is then emacs? ;-)

But you may only see one of those at a time. It was rather annoying having to switch back and forth between screens when attempting to copy a config file.

Increased file system size is hardly a major feature as far as I'm concerned, and since when was networking integrated? Task switching seems interesting, but I've not seen it on any of my DOS boxes, and according to an MS-DOS engineer in another group, it never turned out to work.

Thanks for taking the trouble. But I wonder if you'd be better off using a more modern editor such as QED or Luna, both of which are still being developed. QED at least does not (AFAIK) suffer from Everest's annoying and destructive habit of lopping off the end of long strings in imported text.

If you're using a text editor for programming, then you might care to look out for Quartz. The resource file for this has been translated into English by DDP, and is currently undergoing final checks.

The latest GhostScript has a kernal numbered 6.01, is that what you mean?

If so, the binaries can be downloaded from the Chapelie ftp site.

You'll also be pleased to learn that all the English stuff for that
version (1.3) is available on my web site (MISC section).

Does that help?

swampfox1@earthlink.net said:

> What bother's me mostly now is the difference
>between Rx and Tx rate. At 56k, my modem Rx is about 45k and the Tx is
>about 26k. Falcon port hardware problem? Or is this normal? 115k is
>still a disaster!!!

I believe that's normal - TX is usually around half of RX. My last two
blink speeds on a Falcon and unbranded cheapo modem were:
LAST TX rate..... 28800 BPS
HIGHEST TX rate..... 31200 BPS
LAST RX rate..... 49333 BPS
HIGHEST RX rate..... 50667 BPS

Normally I get 28800 to 31200 TX and 50667 or slightly higher RX. This
is on a London C&W/NTL line, split with a phone on the master socket.

typed:

>What would be the best and easiest programming language/program to make
>simple games on a Falcon? Thanks.
>
>Joshua.

I personally love GFA Basic. It's scalable on a programming level, so
you can program slow and kludgy high-level, or use lower level
functions and techniques to achieve better speed. And when used in
conjunction with the SpriteWorks package, it kicks some serious,
serious butt. I was working on a game in SpriteWorks before I sadly
dropped out of the ST scene, and I was getting some great results.
One example: 8 32x32 sprites bouncing around on-screen with digital
11KHz sound playing in the background at 30 frames per second using
SpriteWorks' sprite engine. Another routine had one giant sprite (I
think it was like 128x64) bouncing around in that "unlimited sprites"
technique (using 3 pages of flipping) with an 11KHz
interrupt-independent sample playing in the background at 20 frames
per second (_without_ SpriteWorks, just pure GFA). Then my main,
in-game routine had as many as 32x32 sprites animating, with a custom
mouse pointer and a 4 channel MOD playing at 11KHz in the background
(using SpriteWorks' interrupt-independent MOD playing routine) while
still maintaining a solid 30 frames per second. In still another
routine I cobbled together a little demo that had palette switching to
achieve simulated 32 colours on screen at once on a 180x100 image,
that moved around the screen with some miscellaneous stuff going on at
the same time, all at 30FPS. Want some good examples of games done in
GFA? Get anything by Dave Munsie (Ms. Munchie, Kid Kong, and numerous
others) or check out the demos for SpriteWorks. I think I still have
the SpriteWorks disks I ordered way back. I should see if I can turn
them into ST disk images (assuming they haven't bit-rotted)

If you do get into GFA (and I really reccommend it highly, far more
than STOS for its flexibility and power) also see if you can get the
GFA Expert documents. They're invaluable in that biblical way for
anyone who programs in GFA and wants to learn the real down-and-dirty
(but still system-legal) tricks and tips for squeezing the last ounce
of performance out of GFA.

HI!

My vocal cords are a bit fucked up right now, and I
can't speak for a while. Where can I find ST speech?
(I belive it was called that)

Thanks in advance.

123techno...

Currently I've two TT030 (1 with graphic card) and one Hades 060. Soon
I'll get a megaST4 too.

I went back to the TESS site and did a search for all entries with the corporate name of ATARI. The database yielded 353 entries, mostly video game titles. But interesting hardware entries are included, like SPARROW, LEOPARD, CHEETAH, and TIGER. Maybe I missed it, but I couldn't find TOS or TT.

Below are two entries for the name ATARI, some products having no affiliation with the computer company (e.g. jogging suits and bibs). The company even had ATARITEL trademarked, part of their telephone business. Other entries come to mind, like TRAK-BALL. The third sample below is ATARI FALCON 030.

The site presents an interesting corporate history of Atari (and other companies).

Hi,

As my 'signature' shows I have a few Atari's too. And working everyday with the TT which still help me running my profession...

One of the TT's has a Nova graphic card, a 64 Mb RAM and a 2.1 Gb HD. One of the other has a Crazy Dots graphic card besides the 'norma' configuration. For several other and also nostalgic reasons the third one is in its 'initial stage' in which is has ever been sold. The Stacy still accompanies the TT's when I have to do some writing or working in for example the Cyber series. The STBook is been used rarely because of its 'value': (there were not many produced).

Raoul Teulings
3 x TT, 2 x 1040 ST, 1 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

By all means do try VMS, if you can. I understand that you can get VMS for
free nowadays (the "hobbyist license"). I have used VMS and programmed on
it for years on a couple of VAXes and hope to do so again on an Alpha
(Compaq says it will support VMS for the next 15 years or so). In all those
years the stability of the system was always superb, in a heavily loaded
multiuser little network. The matter of bugs was practically nonexistant.

Another angle: some time ago I had a chance to run a little floating-point
benchmark (whetstone) on a 266MHz Alphaserver 1000 with OpenVMS6.* and
compare it to the same program running on a 440MHz PII PC by Compaq. On the
Alpha the test executed about three times faster.

It appears that any serial mouse can be adapted to Atari by a rather severe hack- that info floated into comp.sys.atari.st.tech a while ago. And it looked reasonable and perfectly feasible. It amounted to: rip-off (almost) all electronics from the mouse (leave just the LEDs, photodiodes and power-supply resistor(s)) and squeeze in one TTL-compatible buffer chip for the quadrature signals. Then change the cable, because more wires would be needed. On the other hand, WHY would one do so is questionable- maybe only if someone had an especially nice-looking and mechanically sound serial mouse and he wanted to use it on an Atari.

I wou like to mention that it also works nice with PD desktop Teradesk 1.4a which I found excelent for a system with limited memory (i.e. ST, STE, MegaST, MegaSTE). The desktop program is VERY small (about 100 KB) and at first sight it looks almost like the original TOS 2.06 desktop. In fact, if it only had a few more options I would like, I'd use Geneva+Teradesk as permanent setup. It is a pity this desktop has not been developed more.

It seems so. Just checked SAK's (Swedish Atari Club) database and there
are 26 in the Stockholm area (postal code 1), 53 around Gothenburg (4)
and 35 listed in Malmï¿½ (2). Some of these have left the club in 2000 but
most are still active members. The club is based in Gothenburg but it's
interesting that the southern Malmï¿½ area has far more members compared to
Stockholm with its greater population.

Anyway this proves there are still quite a few Atari users left in
Sweden. If anyone wants to advertise Atari products in our quarterly
magazine contact the club through me...

Btw. I run two TT's, a Mega2, Mega4(1280*960mono), MSTe, Stacy and a
Portfolio.

Your newsreader uses a more unusual format for the year:
>Date: 10 Mar 01 22:38:40 +0100

FamilyNet Newsgate

Hello Iggy,

ID> I'll have to try VMS...

I liked it, DCL was friendly and easy to set up for people.

ID> AmigaDOS is much the same, too, with commands and
> arguments such as "List QUICK SINCE Yesterday".

I particularly liked the AmigaDOS command 'why'. AmigaDOS might throw an error, and you could type 'why' and it would give you a more detailed explanation.

IS> I really hate the UNIX way of supplying arguments,
> with totally nondescript one-letter arguments.

I think more commands have longer 'plain English' options these days, maintaining the short form for compatability and for those people who know what they mean, and just want to get the job done quickly.

ID> After all, that is the entire reasoning behind the
> UNIX-centric open source community. Give away the
> software for free, sell support. It's probably a
> lucrative idea if your name is GNU, but it really
> doesn't encourage development of user-friendly
> software.

I disagree, if anything it actively promotes friendly software! Suppose I write a program that is fairly powerful, but hampered by a hideously cryptic syntax. If it's closed-source you would have to re-write it from scratch (which you might choose to do anyway). With open-source software you can rip the engine out and give it a nice GUI front end for use by end users, or a more human command syntax at least. Putting aside our debate regarding user interfaces for a moment, the open source movement is having an important positive effect on the industry as a whole.

ID> Well, at least that is a funny aspect about these
> large, complicated systems; it's so easy to appear as
> a wizard to the lesser knowing.

I see what you're saying Iggy, and sadly I've seen some IT 'professionals' who tried to promote themselves as masters of some secret art. Happily I've found that users respond

in a much more positive way to someone who tries to make life easier for them, enabling them to get the job done without jumping through hoops for the IT department. It's also a good sign if an engineer can explain something in plain language (rather than hiding behind jargon) - it suggests that they have a good understanding of what they are describing.

Regards,
- Andy Ball.

Ah, that's an upgrade which I've postponed into the far future... like the
21st century. ;-)
However, if it strikes Atari readers, I suppose I'll have to prioritise the
2.6a upgrade after all.

We have three VAXes at the usergroup; one MicroVAX IIGPX which runs NetBSD,
but dies whenever a few packets cross the DEQNA, a MicroVAX II which we still
haven't run, and a MicroVAX 3100 with a hard drive, OS unknown due to lack of
RJ11 serial cables.
I can't seem to find any information about how much it would actually cost,
though. One would have to be a member of DECUS, and then I suppose there are
media costs. I�m discouraged by the Tru64 hobbyist licence, which amount to
50 USD IIRC.

>Another angle: some time ago I had a chance to run a little floating-point
>benchmark (whetstone) on a 266MHz Alphaserver 1000 with OpenVMS6.* and

Mostly, plug it in. But you will need a small bit of hardware to convert
the Atari Computer System Interface into the Shughart Computer System
Interface, sold as Link, Link 2, Link 97. These look like cables with
a lump of electronics at one end.

FamilyNet Newsgate

Hello Iggy!

ID> I can understand the operation of programs such as
> "mail" or "ed" due to the nature of teletypes, but
> isn't giving commands such terse names puishing it a
> bit?

That may depend on how frequently you use the command in
question. I'm glad ls is short for example, but wouldn't
claim it was intuitive.

ID> Still, it's faster to type even on the most modern of
> terminals.

Agreed, and it's one of the reasons that 'mail', although
antique, is my own primary email client software.

ID> Not as efficient, but also a negligible overhead on a
> CPU running in tens of MHz.

Depends on the GUI in question <throws Microsoft Windows a
suspicious glance>

ID> If a GUI is inefficient, what is then emacs? ;-)

I really don't want to talk about EMACS.

ID> But you may only see one of those at a time. It was
> rather annoying having to switch back and forth
> between screens when attempting to copy a config file.

There are more efficient ways of copying a config file ;-)

ID> Increased file system size is hardly a major feature
> as far as I'm concerned...

For some applications it's an important feature.

ID> ...and since when was networking integrated?

It wasn't integrated with MS-DOS, but important support for
it was. I have a vague recollection that Novell DOS may have
come with with peer to peer networking capability, but that
was a long time ago and I could be wrong.

ID> Task switching seems interesting, but I've not seen it
> on any of my DOS boxes, and according to an MS-DOS

> engineer in another group, it never turned out to
> work.

Worked for me.

ID> I don't think it's needed to reflect flexibility
> through complexity.

Sometimes complexity is a consequence of flexibility, but
that doesn't necessarily mean usability has to suffer.

AB> From a client-side point of view, unix probably makes
> a good kernel, but I would choose to hide the detail
> (and the shells) from the user.

ID> See MiNT. =)

I've used MiNT before, a few years ago. I would probably be
running it now, but I can't seem to find an early version of
TOSWIN (that doesn't require NAES). What did you mean by
'See MiNT'? It could be interpreted a number of ways.

Hello Jim!

JD> But you will need a small bit of hardware to convert the Atari
> Computer System Interface into the Shughart Computer System
> Interface, sold as Link, Link 2, Link 97.

That's Small Computer Systems Interface (SCSI), which I believe may
have evolved from the Shugart Associates System Interface (SASI).
The advice sounded bang-on though. Out of interest, do any of the
'Link' host adaptors avoid the peculiar requirement of disabling
parity on SCSI devices?

There IS a freeware compiler for GFA but I forget its name ATM. From what I
remember it is from Sweden - you just send a postcard to the author and he
will give you the code to unrestrict access. Was it something like
"Lucida"?? Help!

Hi Gil

> I have a SCSI external CD-Rom drive I use for my Amias and Macs, How
>can I use it with my Atari ST?

Firstly you'd need a SCSI adaptor of some sorts, presumably you already have a SCSI hard disk in which case you have that already, if not then you'l not get far without one.

In total you'd need a SCSI adaptor, i suggest the 'Link', a Hard disk driver, i suggest 'HD-Driver', some CD software, that could be got for nowt if you want and thats called 'SPIN'.

You'd need to connect your CD rom into the SCSI chain after any existing Hard Drive, you'l need to make sure any termination is removed from the Hard Drive and if your using a 'LINK', that TermPwr is enabled by either the CD-ROM or the HD, preferably both, you'l then need to change the SCSI ID of the CD-ROM so thats its higher than the HD's ID as HD-driver will try to boot off the lowest ID, you will need to terminate the CD-ROM using its on-board termination or by external means.

Now, install and set up all the software as per the FM's and all should work.

Good luck.

>>hopefully I will find out soon.

>Thanks for taking the trouble. But I wonder if you'd be better off using
>a more modern editor such as QED or Luna, both of which are still being
>developed.

QED is my choice, but as for its development thats a good question?.
Its not seen any work in a while, it does have formatting bug's.

I found problems with it and Newsie related to the OLGA protocol
resulting in my going back to Everest for News use until i discovered
eMailer, (translated by those marvelous dudes at DDP in case you didnt
know, along with other high profile software such as Fiffi and Jinnee,
give em a raise i say, English resources available at a web-site near you
now <insert URL>).

The last release (4.53) was yonks ago, Christian Felch <sp> has never
answered my emails, i reported some bugs in the resource translation long
ago, and a list of other bugs i could create, no replies..

QED was sponsored by ASH according to show-inf, but no mention was ever
made of it by ASH as far as ive seen?.

So whats its status dudes, is it dead or is it just sleeping, stapled to
its perch.

>Oh, I also run MagiCMac on my Macintosh Quadra 840av.

Ok, here's my setup.

3 STs in the roof.
1 STE, towered, IDE adaptor various hardware mods, TOS 2.06 etc
1 Falcon, in need of a good accelerator (not this Phantom rubbish)
1.7Gb IDE HD, 48X ATAPI, ZIP 250, GT9500,

Main software is Papyrus, Scooter and soon Magic, NVDI, Scripter and
Jinnee.

The STE and Falcon is of course in a PC tower case, Falcon one spashed
with blue LED's and mental amount of cooling fans. Thermometer
trigged BTW, with LCD readout :)

Pic's will go into my website when film is developed. Website will
also include how to do all this to your Atari and my hardware
list thingy.

Bye

Hi,

I have hmmm:

1x 16K Atari 400 (NTSC) looking for PAL version.... anyone?
1x 48K Atari 800 (PAL) + 810 diskdrive + 410 cassete recorder + 128KB
axlon memory upgrade
1x 16K Atari 600XL (PAL) + internal 64Kb
1x 16K Atari 600XL (PAL) + 1064 Module
3x 64K Atari 800XL (1 with 65c816)
4x 128K Atari 130XE (1 with 1Mb simm)
2x 64K Atari 65XE (All upgraded to 128K)
3x 64K Atari 800XE (1 with 1MB simm)
1x 64K Atari XEGS + keyboard
1x Atari Portfolio + Parallel port adapter
1x Atari 2600 wood (4-switch)
1x Atari 2600 black (4-switch)
2x Atari 2600 jr
1x Atari 7800
2x Atari Jaguar (No CD-rom player yet....)
1x Atari Lynx I
1x Atari Lynx II
1x Atari ABC 286-30
1x Atari 260ST
2x Atari 520ST (1 with pc-speed & alladin)
1x Atari 1040STFM
1x Atari Mega STe
1x Atari TT030
1x Atari Falcon030 (14Mb/4 Gb/ FPU/Falcon-speed/Screen-blaster)

ehm... I really think I have forgotten about the rest I think on the attick
there are atleast the same number of machines packed in boxes, I don't have
the place right know to use them, but I am thinking of ways to create more
room in my house so I can finally setup all my systems...
I also have very much Atari hardware like 20 different drives/speeder kits
for Atari 8-bit series. I also have lot's of other stuff maybe when
everything is put in my database I can put a complete list online...
My favorite machine for programming and hobby is: Atari 130XE (1Mb) with
Blackbox abd 676Mb SCSI harddisk and CD-ROM. Secondly I have 2x IDE
interfaces for 8-bit a second Black-box a lot's of other things....

The Falcon030 is nice to play with, I like to use it audio and sampling....
due to lack of time the setup isn't completly done... My TT030 has a big TTM
19'' monitor, I gonna use it for internet, I just installed CAB 2.8 and
Iconnect on it...

Hi,
Some of you have really impressive collections of Atari machines... :)
As for myself, I only have one Falcon left now - and for nostalgic reasons,
I'll never part with it.
My current musical PC system works much better than the Falcon ever did
(even though the Falcon was really stable and almost never gave me any
trouble) - but even so, I liked the Falcon so much that I don't have the
heart to sell my last Falcon machine... ;)

3493. STING with CAB 1.5 and aICQ problem!!!!!!!!

Newsgroup: comp.sys.atari.st
Date: 2001-03-11 18:20:03 UTC
From: firest@williams-net.com
Message-ID: <tangejp6o0tn2f@corp.supernews.com>
Source record: 49013

Anyone,
I am using STING version 1.20 with DIALER version 1.16 and am having problems with CAB 1.5 and aICQ functioning properly. With CAB 1.5 I can type in a URL then it kicks me out of the program and gives me some bombshells on the screen if I try to go back to CAB it locks up. With aICQ it boots up and I try to enter in stuff for new user and it does pretty much the same thing. But I use NEWSIE96 and I have know problems. I would say that if I do not transmit data or recieve data for 10 to 15 minutes I will lose my connection. Do I have something configured wrong in the KONTOLLFELDER at the top when you go to desk and click on this program STING PORT and STING INTERNALS comes up along with my other CPX modules. I guess I am trying to say WHAT AM I DOING WRONG!!!!!!?????!!!!! Have not encountered this problem until about a 2 or 3 weeks ago. I had been able to use my CAB 1.5 just fine. Any help on this matter would be greatly appreciated. I am using a 1040STf with 2.5 megs of RAM and US ROBOTICS 14400 modem if this helps. If a newer version of STING is needed please include it as I cannot go on the web with my ST to grab the newer version. Since CAB 1.5 is also acting up. I would very much like to get my aICQ to work with STING as well as CAB 1.5. Thanks for any help that can be given.

Thanks,
Carey

This is correct for all US spec machines. All series 2 PAL A1000's came with
C= logo, no daughterboard either.

I
> remember it is from Sweden - you just send a postcard to the author and he
> will give you the code to unrestrict access. Was it something like
> "Lucida"?? Help!

Is that the one mentioned in the GFA FAQ? (I'll check in a minute!).
Looking through Dejanews last night I found references to a freeware
compiler, but this one was a con.. didn't actually compile anything, just
wrapped up the GFA source with the runtime libs to create an executable
program..

However! After literally minutes of searching I've found the magazine
article which gave me the idea that GFA 2 was freeware..

From "Public Domain" magazine, issue 1, November 1991, page 10:
==========

ST users on the lookout for a better version of the BASIC programming
language can pick one up at PD prices. GFA Basic version 2 is available
through selected PD libraries for little more than the price of a disk. The
program is licenseware rather than PD, so must be obtained through official
sources. Users can purchase a compiler and manual for just £20.

==========

Is this at all relevant? Was the offer eventually withdrawn?

"Riverdene" public domain library is one that is mentioned as an official
GFA2 distributor... I don't suppose they still exist?

Sorry... soooo many questions!! :o)

I've just got into using an ST emulator and I'm dying to do more than just
play games on it..

Cheers!

Norman.

3498. Aegis Animator

Newsgroup: comp.sys.atari.st

On the same track as my other post (i.e - getting as much stuff for free as I can!!), I found an article in an old ST World mag announcing that "Aegis Animator" has been released as public domain. I remember having fun playing with this & would love to get hold of it again..

As it is freeware it's perfectly legal to put it on the 'net for download, but I can't find it on any ST websites..

Does anyone know of a site which offers it for download?

Or, if anybody has a copy, would you consider putting it on the web?

Cheers!

Norman.

You could try re-installing Cab 1.5 or else get the latest version which is
2.8. You could also try installing STiK2. It is much easier to use than
STing.

Sorry to have missed the original of this. I have a Hades, TT,
36MHz Mega ST, standard Mega and an old ST with external floppy.
The TT is lent to a society and I am giving their Mega STe house
room.

The Hades is used daily, the TT and accelerated Mega are used every
few days, the standard Mega and Mega STe are used occasionaly, and
the fifth not at all.

Here I am again, with my HDDRIVER problem...

>> So, how could I check my Falcon, which I suspect to be faulty ?

>I don't think so. I already answered your e-mail, so I won't repeat
>myself right now.

I had the opportunity to try my 0662-S12 drive on a TT, instead of
the original 52Mb HD. As on my F30, HDDRIVER was unable to detect
it. So, in spite of whatever having been wroten so far, HDDRIVER is
not able to drive all SCSI devices. My 2 IBM 0662-S12 HDs and my
Sony SDT-2000 streamer are such devices. Unfortunately, I can't
find the docs of the streamer anymore (I wasted more than 2 hours
on Sony's site, with no result), but I found information about the
drives on IBM's, and it results in the fact that there's nothing
that could be done that I didn't try.
So, please, would it be possible to have a perfectly working version
of HDDRIVER, that should work with any existing SCSI devices ?

Thanks a lot,

J.-Luc

Milan, now there's a computer I wouldn't have minded trying. You know, if they used the cute anime picture that MyAtari had as it's cover art (Say Goodbye to Milan issue) I think more Milan's would have sold. ;)

Anyway, as for my setup....

Atari 400/800 48K connected via null modem connection to a....
MegaST/2 (for 80 column translation for BBS'ing/internet) & via SIO2ST to 1040ST 4 mb/AdSpeed for the 800XLDJ virtual drives.

All other variations of the Atari 8-bit or 16 bit are backup machines for this setup. :)

Also have 2600, 5200, 7800, Lynx, and Jaguar.

Favorite Atari hardware to date...

Atari 400/800, Jaguar, and Lynx. In that order.

ST makes a great application machine. (and serves my Atari 800 well) ;)
Spectre (Macintosh emulation) is fun to play with on the ST.
In reverse token, I also have MagicMac (Macintosh emulating a ST) on a 68040 Performa 575.

Take care,

Doctor Clu

Newer type links like the LINK96/97 support parity, i. e. you don't have
to switch the parity checking off on your device.

I use ls all the time as well, but whenever I have to customise the output, I use List, since its arguments are based on human language instead of anonymous single letters.

ID>> Still, it's faster to type even on the most modern of

Well, but Novell DOS is another business. after all, Novell DOS existed
because there was no networking in MS-DOS or PC-DOS.

True.
What makes UNIX such a pain nowadays, though, is that a lot of common people,
who aren't paid to administer minis, have to administer a system which should
have a professional manager. If you're an end user on a multiuser system,
UNIX isn't all that bad, since you don't have to install your own apps or run
compilers and so on.

AB>> From a client-side point of view, unix probably makes

MiNT is exactly that, a UNIX (BSD) kernel, hidden from the user.
Another example is MacOS X.

Open source is not without its merits, but if your idea of business is to sell
support, making a program self-supporting really isn't good business sense.
The most high-profile open source projects are Linux, the BSDs, GNU,
Ghostscript, etc. None of these are particularly easy to use.

Within several messages, hsc refers to the user as a ``jerk''. This happens if you are using features which are only supported by some special browsers. Some people say they are forced by their employer to use those features, and therefor feel insulted by hsc.
As a solution, you can store the amount of your monthly payment in this variable:
setenv HSCSALARY 1000
After this, hsc will stop calling you a ``jerk''. Instead, it will now use the term ``prostitute''.

3517. Standard SVGA monitor with an ST

Newsgroup: comp.sys.atari.st
Date: 2001-03-12 10:59:04 UTC
From: Graham Stoneman <G.J.Stoneman@warwick.ac.uk>
Message-ID: <3AACABF8.60DC5EF8@warwick.ac.uk>
Source record: 49043

Does anybody know if it's possible to use any standard SVGA monitor with an Atari ST? With the correct pin diagrams for both the Atari and the monitor, is it possible to wire up a small converter? Failing that, is it possible to buy a converter from anywhere?

Thanks,

Graham.

Source record: 48948
Cross-posted to: alt.comp.virus,comp.sys.atari.st,hacktic.virus

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for well over a decade, and with the latest release (8.1) it's turned shareware.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com (this is a new URL!).
I have this week off and it looks like I am going to release an update...
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me at cronos@atari.org and I will refrain from posting to the newgroup in the future.
Thanks for your time.

I think that the "Link97" will handle parity (despite the familiar-sounding
name, this isn't made by ICD).

Otherwise a parity generator design was published by Martin Graiter a long
time back, most likely it's on Vazz' hardware tweaks site.

If it had been working fine then you must ask yourself what's changed. Have you been playing around in the auto folder? Perhaps you've got the running order wrong, so that sting.prg no longer runs after the hsmodem stuff as it should.

As for the CPXs, you only need serial.cpx and the internals CPX (the latter isn't needed with the latest STinG BTW).

> > of HDDRIVER, that should work with any existing SCSI devices ?
>
> I'm sorry, I have no clue why there is a problem. Anybody else with the
> same problem/drive around?

Yup, I have ten of the things, 0661-467s, 312mb.
Pretty old, not worth a lot of time to sort.
Some will work on ICD pro, some will work on HDDRIVER v7,
some on the Link 97 / 8 and some on the ICD Link II.
Some won't work at all. None worked in my TT.
The ones that worked were pretty rapid, no activity led or term power
available.
There is a SCSI options pin but the details are missing from the IBM site
printout
The specs are on IBMs site.
Happy hunting.

Barrie at Keychange.

>Hey, Jï¿½rgen, what character set does your NEWSie output? Your ï¿½ doesn't come
>out correct, and is reported as an ascii 94(?) by Thor.

It's 94 in hexadecimal, yes. Afaik Newsie doesn't care about the
character set at all. It simply outputs whatever you "feed" it with. This
works fine as long as you don't use anything but the standard 7 bit
"international" ASCII A-Z,a-z characters. If yo type ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ etc the
normal Atari ASCII codes for these characters will be used.

Newsie doesn't put any character set info in the header so your
newsreader actually must guess which is used. As iso-8859-1 is common on
the Internet (and Amiga!) this is probably what your newsreader tries. A
better guess would in this case have been cp-850 or MS-DOS ASCII that is
similar to Atari ASCII.

As this problem is (or was) quite common in the Atari world my newsreader
Okami uses a sort of combination of cp-850 and iso-8859-1 where you can
actually use both versions of ï¿½ï¿½ï¿½ in the same letter and they all display
properly. When I reply they get translated to iso as the header indicates.

This also makes it possible to both type and read some of the more
"esotheric" characters that hides within an Atari. The two lines below
are actually a picture showing a man smoking a pipe:

There have been some complaints about pc people who use MS-DOS ASCII in
Swedish newsgroups but this worked completely transparent in Okami!

>
>--
>En ligne avec Thor 2.6.
>

While we are talking newreader issues, your SIG delimiter doesn't work.
There should be a space at the end like "-- ".

It has a built in graphic card and uses a 19" "Moniterm" monochrome
monitor. This resolution is more common in TT:s known as "TT high" and
great for text and b&w DTP as you get the same pixel sharpness as on a
standard SM124 640*400 mono monitor.

It certainly is, you'd have to get some opinions on what monitor is
suitable.

The details for the adaptor/convertor are freely available on the web,
dont let some unscrouplpous dealer attempt to /sell/ them to you.

>Thanks,

Your question made me try something that has been in the back of my head for some time. I have a Hades060 and use a SVGA OptiQuest 17 inch monitor. I also have a Video Key. You remember that. It allowed any Atari ST to be hooked up to a TV. It also had a RCA jack for the video out and audio out. I hooked that up to my 1040 STe. I then plugged in a cord to the RCA jack video-out and ran that to a video converter (the VGA-801) and plugged in the other end of the cord to the video-in on the converter. I switched the converter to the AV mode and I got a picture. I admit it was not perfect, it had some waves, but it was good enough to use. I ran some game programs just to see how it looked and I was impressed. It was of course a much bigger picture.

The VGA-801 is a great video converter and I also use it to work with my Atari 800XL and 130XE. I got it from a place in Illinois called Matco. The URL address is: http://www.mat-co.com/

Of course it would be nice to have a cable for the ST that just has the video and audio outs as a RCA jack. This would eliminate the video key. If one is ever made, I would buy it.

Hi All,
I'm looking for the schenatic (or even better, the service manual)
for the Alesis 1622 mixer. Alesis corp. won't repair it. The parts dept.
has no files (paper or computer) for that mixer. They've disowned it!!!
Their service companies trashed any records of it and won't service
it either.
I've downloaded the product manual from their website. * 240k PDF type!
Can't tell if there's a schematic in there somewhere (Ghostscript is
good but 240k is a bit too much for it and my stock Falcon!).
Any info is appreciated!
John G.

Nah its a open source PC, already got one. No custom trickery at all, how
boring. Now the Gamecube will have a PPC gecko chip in it, that's a console.

Lyndon, Lyndon, Lyndon, (shaking head), the PS is RS, it was ancient when it
went into production, it is barely faster than a 386. No high res, crap
graphics in general. I can't stand the chunks. BTW sony used Nintendo
technology to pioneer it anyway.

Hello Iggy,

ID> I use ls all the time as well, but whenever I have to
> customise the output, I use List, since its arguments
> are based on human language instead of anonymous
> single letters.

That sounds fair, and it's good that we have the choice.

ID> Brr. I use Pine on unices.

There's a campus near here where all the students, staff and
faculty are given unix accounts, and most people use PINE.
It probably makes a lot of sense for the majority of users.

ID> Well, but Novell DOS is another business. after all,
> Novell DOS existed because there was no networking in
> MS-DOS or PC-DOS.

I suspect it was more political than that. Novell had a
server operating system, but no desktop OS to sell along
with it, so Microsoft were getting the extra revenue. I
believe buying DR-DOS was a sensible move for Novell, I
can't comment about what they did with it afterwards.

ID> What package did you use for task switching?

Various, but when I wrote that I was thinking primarily of
MS-DOS 5. I know the MS-DOS shell appeared in MS-DOS 4, I'm
not sure if that had the task switcher though. I believe the
shell and task switcher was also supplied with MS-DOS 6, but
probably wasn't installed by default.

ID> What makes UNIX such a pain nowadays, though, is that
> a lot of common people, who aren't paid to administer
> minis, have to administer a system which should have a
> professional manager.

Agreed, and that's symptomatic of something I see quite a
bit of. Orphaned networks with no administrator - and often
no administration: backups, virus scans, routine maintenance
<shudder>

ID> MiNT is exactly that, a UNIX (BSD) kernel, hidden from
> the user.

It can't have been that when I used it, because it ran on a
68000 that didn't have a paged memory management unit (PMMU)
perhaps was modelled on BSD though.

ID> Another example is MacOS X.

That's an interesting thing. MacOS X has a BSD kernel, but
a friendly graphical shell. I have a friend who uses it on
a G4 server. I believe NeXT may have done something similar
with NeXTstep. Perhaps Jobs is behind it? <grin>

Hello Kevin,

KM> It's 94 in hexadecimal...

Hmm, I make that 148 decimal, which falls outside the ASCII
character set. Because it's a 7-bit standard, it ranges
from 0 to 127 (decimal).

Regards,
- Andy Ball.

hmm. That sounds familiar - by chance, is it that big grey mixer that
uses no audio pots on it, but instead uses wipers pulling along contact
points on the circuit board?

I just downloaded the manual from Alesis' website and looked through
it with Adobe Acrobat. Unfortunately, there are no schematics included
with it.

You might want to try asking in alt.music.4-track , there might be
some users there who have that mixer.

Hi Daniel,
Yup! That's the mongster! It's easy to see why no one would attempt
servicing it. The first time I opened it up to clean the contacts,
every knob and slider (243) fell out!!! (insert loud profanities here).
So I devised a rig (of 4 bottle caps for the corners) to hold the upside
down front panel off the desk. But the board can't be fired up without the
front panel on! So a signal can't be traced!
An alesis manager told me to build a simple one myself from Radio
Shack parts and it would sound better than their 1622 or trade it in for
one of their newer ones. Sorry man! Only fool me once!!!

Thanks for the NG info,
John G.

This is not correct. TOS is responsible for selecting the device it will
boot from, not the hard disk driver. And TOS will only boot from
bootable hard disk partitions, not from a CD-ROM. TOS will ignore it and
will try the next device.

I'm using the VGA-801 too to connect my 800XL to a multisync and I'm
very satisfied with the results.
So at the moment I switch the multisync between Falcon and XL and I've
been searching for quite a while for a device to allow me to use the
multisync with the ST too. Only one monitor for all three computers
would be great.
And that brings me to the question of the Video Key. I never heard of
that. Does it really have a composite video output ? Is it still
available somewhere ?

> Of course it would be nice to have a cable for the ST that just has the
> video and audio outs as a RCA jack. This would eliminate the video key.

I would buy it too.

Gerhard

I'd say you are a little lazy :-) It took me about one minute to have a
textversion displayed in CAB2.5 of the Alesis manual:

http://www.google.com/search?q=cache:www.alesis.com/downloads/manuals/ra100_man.pdf+%2BAle
sis+%2Bmixer+%2B1622+%2Bpdf

[Strange, I thought CAB2.5 had problems with long url's but this one got
pasted right from CAB into QED]

The searchengine Google http://www.google.com/ is a great tool as it both
searches _within_ online pdf documents and converts them to textformat.

Unfortunately I found no schematics mentioned. I also did another quick
search and found a place with lots of manuals of different kinds. The
have "repair manuals" for lots of similar equipment but not a single
Alesis one. They do however have a lot of Alesis owners manuals. To me
this sounds like Alesis have kept there schematics a secret...

Or you may simply use another "keyboard layout" _and_ different "display
font" like with Harlekin-95. I used this method back in the past when I
used Oasis 1.35 and NOS.TTP for news. But, mayby Harlekin does not work
on your setup.

As a simple workaround you could simply use ï¿½ (CHR$(246)) in your name
instead of ï¿½. This will make all Amiga/Unix/Windows fans happy...
[Just wondering what the ï¿½ character will show up as after export?]

Remember the old, elegant but not perfectly clean written KEBSWE7.PRG
that lets you switch between Swedish 7-bit and Atari ASCII on the fly by
just pressing some "magic" keys?

But, as you perhaps can see from my new subject line [I think Okami is
setup for QP in headers. We will see when it is posted...] Newsie really
can't be used for anything but straight English if you want to be the
least RFC compliant.

If you need perfect national charcter handling get Okami. I have been
rather pricky sometimes in some swedish newsgroups about these technical
matters and never gotten any relevant critisism back regarding Okami
message formatting :-)

Anyway, quite fun to use QP (Quoted Printable) in the subject line as
Forte Free Agent could not handle it. When they complained I simply asked
them to try and get a more modern newsreader that supports this feature.
And this off course with the "Produced with 100% Atari" in the signature
:-)

I'm very confused because I don't have any links to ZOO format files. Maybe you've found the main GhostScript site which has files for many computer platforms but not (AFAIK) the current Atari version. The link for download on my page is, should be, for the Chapelie ftp site as recommended in my original message. If that's not the case please submit a bug report.

>and there ensues another problem: How do you unpack ZOO? I tried a
>zoo.ttp that I had but no go. Went to UMICH and got some Zoo files but
>still no go!

This is a red herring as far as the current subject is concerned!

There is no (real) Freeware compiler. The one mentioned is Manliu Tranqui
(or something like that :-))

>
> However! After literally minutes of searching I've found the magazine

>

Probably not. Gerd Hï¿½ller received rights to distribute newer GFA-Basic
versions (www.hadley.de).
falkemedia in Germany are distributing a GFA CD-ROM.

Greetings,
Matthias

Source record: 48990

1 x Jag (I want another?)
1 x 512ST (broke)
2 x 1040STFM (one with Stereo upgrade which is shit)
3 x 4MBSTE (one with TOS2.06,HD Floppy + Ext, 500MB HD, DAT and CDROM)
1 x MegaSTE(4MB, TOS2.06 and HD Floppy, I want to increase the speed?)
1 x Falcon (Stock 4MB + 64MB HD, will soon have a CT060 when they are ready)
1 x TT (20Mb,1Gb HD, SyQuest 44, CD ROM, + Crazy Dots which I can't work,
soon to have CTT030 or 060 whichever he makes)

Some other bits of hardware such as scanners, Ultimate Ripper, Stereo
Master, Synrco Express, Blitz Turbo (even that dodgy external they did which
is also shit), that 16 Channel card for BAT, Playback, about 3 Atari Mono
monitors, a couple of modems and some other external floppy drives.

I also want some network cards to get the lot working together, probably
that cartridge one but I don't know if I should wait for Mario to finish his
network version of his card for the TT and MegaSTE.
CD Writer (anyone recommend software and were to get it from?)
That PPC upgrade for the Falcon (and maybe the TT) would also be cool.

What happened to the ColdFire computer?

That's my budget gone for a few months at least.

Mark.

>from 0 to 127 (decimal).

The old 7 bit ASCII really is obsolete these days. There were different national variants but they are hardly used att all any more. At least not on the usenet.

At least in western countries it's impossible to write any proper text without letters as:

ï¿½i¿½i¿½ï¿½i¿½ in Swedish, Finnish
ï¿½i¿½ï¿½i¿½ In Danish, Norvegian
ï¿½i¿½i¿½ in German
ï¿½ in English (!)
ï¿½i¿½i¿½ï¿½i¿½ etc, etc in French

Apart from this there are some that come in handy in any language like ï¿½ï¿½i¿½ï¿½i¿½.

I don't know if the Dutch still use ï¿½i¿½.

[This is off course also a little experiment to see if Okami translates correctly. I have written this with standard Atari ASCII and some may actually be missing in the iso charset!]

Anyway the de facto standard in the west is iso-8859-1 and if you want to use the Euro sign iso-8859-15 (I think? not supported on Atari?). These charcters are used all the time in newsgroup messages without any problems.

The use of 8 bit characters in headers might be a little more problematic as some servers might choke on them. That's the reason I have set Okami to use Quoted Printable there. But in Swedish newsgroups 8 bit headers are used all the time, so obviously it works well that way too.

Lately national characters are sometimes also used in URL addresses like: http://bï¿½kiga.bokstï¿½ver.nu/ (not a real URL!) which may be a little more problematic. But in the long run this is imho the only way to go. Whithout ï¿½ï¿½i¿½ etc you get all sorts of funny effects that companies and authorities want to avoid.

Depends of which OS you're actually running. I do no remember for
previous version of Magic but Magic 6.10 replaces the character 0x1F by
one of its own and the face is broken. This character is used by Magic
(with the original windframe) for the gadget used to put a window in the
background.

Bye,

Hey,
My Atari 1040STe does not work anymore.
When I turn it on, the green light comes on, but nothing else; disk drive doesn't spin, nothing displayed on the monitor etc.
Any ideas on what to do? If its something simple I could probably do it myself, otherwise I'll get it repaired from a shop. Any recomendations for a good repair shop? Don't want to spend too much, as I could probably buy another Atari for £50-odd quid.

TIA

On Sun, 11 Mar 2001 20:24:06 -0000, "Badactress" <look@sig2mail.me>
drooled an embarassing wet spot in his lap as he typed:

>However! After literally minutes of searching I've found the magazine
>article which gave me the idea that GFA 2 was freeware..

It is... but I highly recommend 3.5e (or higher?). v2 doesn't have
nearly the sort of features and functionality as 3.5e does, and isn't
nearly as fast, either. It's fine for getting the general idea of
what GFA is all about, but 3.5e contains so many more features,
functions and capabilities that it's much better suited for serious
development. I'm not sure if v2 was capable of using inline
functions, but these are utterly essential for keeping data (most
usefully, assembly subroutines) internal and readily accessable in
your program. Also, GFA v2 can't "fold" procedures, which I found
REALLY useful when coding. (Hitting HELP over a procedure "folded" it
up, kinda like a collapsable heirarchial menu in Windoze) Plus, GFA 2
can't compile without a third party compiler. GFA v3 has its own
compiler.

There are a lot of other differences, but these strike me off the top
of my head. Anyway, point is, grab v2 just to get an idea of what GFA
is all about, but if you do plan to do any serious coding, I highly
reccommend 3.5e (or whatever the latest is). All my coding was done
in it, and I really loved the language.

>I've just got into using an ST emulator and I'm dying to do more than just
>play games on it..

To be honest I have never tried GFA under an emulator -- I should,
though. It's been quite a few years since I even laid eyes on GFA,
but I'm sure I could pick it up again relatively quick. I should go
back and start reworking on Mystic Tiles, which was the game I was
working on before I left the ST. (It was based on a game by Hackbear
(Torbjorn Ose) that fit in a whopping 813-byte executable, making it,
I think, the smallest game in ST history that was actually playable
and _fun_ ... mine was to be a full disk with a 4 channel MOD
soundtrack and everything. :)

> version?

Yes, there is: The LINK97 is the only host adapter that does not block
the bus even when it is not using the bus. With other adapters the bus
is blocked for other computers if you have connected more than one
computer (Atari, PC, Mac or whatever) to the same bus.
As far as I know this is also the main difference to the LINK96.

Not exactly the same thing but you could try contacting Chris Crosskey
at chris.crosskey@metrics.co.uk (Sorry Chris can't remember the other
email address) where I purchased Mario's ST mouse burster (allowing
you to use a PC mouse) and a couple of mice which worked great.
Excellent service.

Message-ID: <3AAE95E4.F35D7A64@boeing.com>
Source record: 48920

Does anyone know where I can get driver software for a PCI SCSI card
for a Milan I? I've been trying to order one from Michael Schwingen,
but he seems to have stopped responding to my e-mails. I'd consider
trying to write my own, but I can't find the Milan PCI Library.
The only link I have to the library, http://www.wvnet.at/97021702/,
doesn't work. If I can't get a driver, I'll have a new SYM20810 card
for sale.

Milton Horst
Seattle, WA USA

3588. Falcon030 and Philips CDD 2600

Newsgroup: comp.sys.atari.st
Date: 2001-03-13 22:38:00 UTC
From: Eick_Wagner@ki.maus.de
Message-ID: <200103132338.a15684@ki.maus.de>
Source record: 48936

Hi,

I have a problem with writing Audio CDs with my Falcon030 and the Philips CDD 2600 CD writer.

First my configuration:

Hardware: Falcon030 with 14 MByte in ddd-BigTower
CD writer Philips CDD 2600 (via SCSI)

Software: MagiC 6.1
HDDriver 8.02
SPIN! 0.34

Software used for writing CDs:

SoundPool CDRecorder Pro 3.1.132
CDLab 0.40

With both programmes I always used the option to create a file on the HD before writing to CD.

CDRecorder Pro works fine for creating Data CDs (but doesn't support long filenames). According to the docs it should also be able to write Audio CDs. Everything seems to be okay when selecting *.WAV files (which are correctly indentified by CDRecorder Pro as Audio Tracks), creating a temporary file on the HD and writing to CD. CDRecorder Pro tells me after burning the Audio CD that everything is okay. But when trying to listen to the CD - on a normal CD player or with PlayMyCD on my Falcon - I only hear some incredible noises, and not the music.

It's the same result with CDLab, which is with the actual version at the moment only able to copy a complete CD (via HD image file) to another CD: After writing the CD, CDLab tells me that everything is okay, but the result when listening to the CD is the same as mentioned above.

The Philips CDD 2600 is able to write 2x, that's what I used with CDRecorder Pro. CDLab is not registered (until it works for me), so it offers to write 1x only.

Any ideas? Thanks! :-)

Ciao, Eick

Take it apart, be careful of the PSU (still contains voltage after
being switched off) and press firmly on all the chips that are
socketed. Clean board by blowing dust off and reassmble.

If it doesn't work then come back and I'll suggest possible repair
places, Where do you live?

>>Hey, J�rgen, what character set does your NEWSie output? Your ï doesn't come
>>out correct, and is reported as an ascii 94(?) by Thor.

On my Falcon with CixComm/CixRead and Atari Monaco character-set the 94 character appears as the Hebrew Shin, which is ASCII 214 or $D6! This program performs an ISO conversion, but I don't know to/from *which* ISO set.

FWIW, your other high-ASCII characters came out as:

>If yo type ïïïïïï etc the
Daleth (197/$C5), Gimmel (196/$C4), Rho (229/$E5), Sigma (228/$E4) and
Divisor sign (246/$F6).

>are actually a picture showing a man smoking a pipe:
>
>

This was completely blank in CixRead, but showed up 3/4 OK in Everest - the lower right came out as small white square on a black one; I've never understood why the designer kept three of these 'face' characters but not the fourth! BTW, I can use Harlekin to load in the original Atari or the IBM character-set when necessary. Still doens't help with the 'wrong' umlauts, for instance, due to their different positions on the Atari and PC/Mac in the ASCII table. I have a conversion set up for both via Egale when I need it.

Regards, /Peter/

>I would say that if I do not transmit data or recieve data
>for 10 to 15 minutes I will lose my connection.

It may have nothing to do with you. Maybe your ISP's software is configured to watch for idle connections and break them. Did they make some upgrade recently? Maybe they introduced this then. MY ISP makes a check every 10 seconds! however, STing responds to its queries by itself (I just see modem LEDs blink for a moment) though not quite correctly. If there is, for example, file download in progress, STing seems too busy to respond to a check, and afer 60 seconds of non-responding the ISP hangs up. Luckily only some dial-in nodes of my ISP have been so configured.

Another possible cause, of course, might be STing mis-configuration.
It is very easy to mis-configure :) E.g. too low "delay" in Sting internals CPX may crash the system occasionally.

> I am using STING version 1.20 with DIALER version 1.16 and am having
>problems with CAB 1.5

I suggest you upgrade as soon as you can get to the net. There is STing 1.26 and CAB 2.7 demo is quite usable if you just have patience to wait for the startup/exit delay. And if you search on the net a little more...

Maybe the hardware is showing its age, after all those years. Often it is
the contacts on the boards. Maybe if you clean with the before-mentioned-here
fibre-glass pencil it will get better for a while. I have no experience with
NetBSD- just VMS. Used DECNet on it and it worked simply and reliably.
There is also some "Fusion" TCP/IP package sitting somewhere on one of our
MicroVAXes but it has never been seriously used.

>OS unknown due to lack of RJ11 serial cables.

Er, I am not anymore very familiar with with hardware-part names- what were
RJ11 serial cables?

Anyway, MicroVAXes (or VAXen?) were nice little machines, I think. Though
quite slow by today's standards. Something like a i386 or i486 speed.

>I can't seem to find any information about how much it would actually cost,
>though. One would have to be a member of DECUS, and then I suppose there are
>media costs. I m discouraged by the Tru64 hobbyist licence, which amount to
>50 USD IIRC.

I think there is a web site dedicated to "hobyist VMS"- maybe there is
some info there.

>>On the Alpha the test executed about three times faster.

>As one would expect. =)

There is a chance we will get an Alpha. As it will have DEC's VMS equivalent
of X installed, a weird thought has crossed my mind- to try to modify and
compile STonX :)

Hello Steve,

G> Does anybody know if it's possible to use any standard
> SVGA monitor with an Atari ST?

S> It certainly is, you'd have to get some opinions on
> what monitor is suitable.

I'm not sure whether Graham wants to use colour or
monochrome modes on his monitor, I imagine this would make a
difference where compatability is concerned. I've wondered
about using a monochrome VGA monitor for ST High res. I
/think/ the video input of the SM125 I used to use may have
been at TTL levels, in which case a resistor might be needed
(I haven't done the math yet ;-) If the sync signals are
compatible (rates, polarity etc.) then it shouldn't be a
hideously expensive prospect. I think I'll search for the
diagram you mentioned.

Sorry can't help you with your mixer, but as you mention PDF problems:
I just had a problem with a 93 kB PDF on my Falcon - it would only show
and print the first 6 pages for some reason. I asked them to resend it
to me in RTF and it arrived ZIPped at some 300 kB, but when unzipped it
was an unbelievable 14 MB! Of course that was too much for my Falcon too
- Papyrus tried to load it but to no avail and eventually crashed out.
The fact that it had some graphics in it didn't help I guess. But I
still can't get over the compression factor - 97% according to 2 in 1!
And all for a 12 page or so document of mainly text...

Regards, /Peter/

Happy,

I dont think you can get anyone to stop being abusive but, thats just my opinion. The best thing to do is set your filters in your newsread to trash the messages from the people that you think are abusive. Theres alot of people in this group that Ive seen people get mad at (myself included) but, I think some of the time a message may come across as abusive but the writer didnt mean for it to come out that way. Were far from being a perfect world.

Cant we all just get along,

Don

I think the problem is not your CD writer but to make sure the
software writes audio data and not .wav files. Did you check after
creating the CD whether there were audio data or .wav files on it ?
I only have version 2 of CDRecorder and there it seemed to set the
CD type automatically depending on the type of files to be written.
But since in version 2 only the whole package including the Audio CD
writer program could be bought (which is far better for writing
audio CDs than the Pro program) I never burned audio CDs using Pro
but always using Audio.

When I purchased my Falcon form Atari Workshop (System Solutions as they were then) they supplied my with copies of three disks contaning the XControl control panel (with CPX modules), AHDI (the Atari HD driver software) SAM (the Falcons audio software for assigning sound to system functions, with sound samples) and a few odd games and demos.
As far as I know this is all freeware that what was supplied as standard by Atari with all new Falcons, therefore there should be no problem send you a copy.
I don't have the disks on me but if no one else sends you a copy, let me know and I will zip them and e-mail them to you.

I'm after an Atari STe in good condition. I don't care about boxes,
software, extra hardware etc... so long as it works it'll do just fine
(a TOS 2.06 upgrade is preferable but not essential).

Please email me with the details & price if you have one for sale.

Thanks,

Graham.

3616. Re: Falcon System disks

Hello!

I did not get any disks with my Falcon either. Please zip one to me too if anyone has got it.

By the way:
Why do we not share all our software?

I have sent a few programs to people asking for special software and my conscience is clear as Norwegian water.
But I am not a thief!
(I even bought a copy of Papyrus when I already had a working copy on my HD. But that was in the days there were dealers for Atari software. No a days I suppose there is no development for Papyrus, so why not let others have it free?
There is no dealer of anything for the Atari here in Norway today.)

Is there any commercial software for Atari beeing developed still?
If so it is not worth announcing a give-away policy, but....?

Source record: 48852

Eric wrote...

>>I have a problem with writing Audio CDs with my Falcon030 and the Philips CDD 2600 CD writer. First my configuration: Hardware: Falcon030 with 14 MByte in ddd-BigTower CD writer Philips CDD 2600 (via SCSI) Software: MagiC 6.1 HDDriver 8.02 SPIN! 0.34 Software used for writing CDs: SoundPool CDRecorder Pro 3.1.132 CDLab 0.40 With both programmes I always used the option to create a file on the HD before writing to CD. CDRecorder Pro works fine for creating Data CDs (but doesn't support long filenames). According to the docs it should also be able to write Audio CDs. Everything seems to be okay when selecting *.WAV files (which are correctly indentified by CDRecorder Pro as Audio Tracks), creating a temporary file on the HD and writing to CD. CDRecorder Pro tells me after burning the Audio CD that everything is okay. But when trying to listen to the CD - on a normal CD player or with PlayMyCD on my Falcon - I only hear some incredible noises, and not the music. It's the same result with CDLab, which is with the actual version at the moment only able to copy a complete CD (via HD image file) to another CD: After writing the CD, CDLab tells me that everything is okay, but the result when listening to the CD is the same as mentioned above. The Philips CDD 2600 is able to write 2x, that's what I used with CDRecorder Pro. CDLab is not registered (until it works for me), so it offers to write 1x only.

>>

Lose Magic for starters, when you're burning CD's get rid of everything that you don't need....I normally reckon on running a system that is clean barring Folder500, in mono hires to run wiht CDRecorder Pro. I have v2 and v3, both data and Audio.....not had a problem yet, though make sure you aren't trying to burn the wav's into an illegal session (ie anythign but the first) and make sure that it is turning them into an audio track rather than a data one...plus I think you're better off using .AVR if it is an option, it's how I've always done it from Audiotracker.....

I have the following, please send offers to
rustynutt@hotmail.com
Not letting anything go cheap, so offer like you really want it.

Mighty Sonic accelerator, 68030 w/32mb alternate ram for Falcon.
Runs at 32Mhz,
and works with Nemesis at 40Mhz. This card looks like an
Afterburner. Recasing
your Falcon is necessary. Only slightly slower than a CT2, but
it has pass through
connectors. $595.00 new.

NOVA Graphics adapter and ATI Mach 64 video card.
Shit load of money new.

Expose, PAL version. Works perfect. Can be modified to work with
NTSC.
Paid $270.00 used

CLAB Mark-X case.
What are these new from Titan, $250.00 ?---------------/
Will only
let one of these go.
Wizztronics Falcon Rack/complete kit/power supply------/
New $450.00

Atari Sparow
Priceless, must want this very bad.

Atari STacy 4, must want this bad as well

Thanks for humoring me,

Mike

3624. Good Spreadsheet

Newsgroup: comp.sys.atari.st
Date: 2001-03-14 21:48:36 UTC
From: jba4@po.cwru.edu
Message-ID: <3aafe4f3.2874126@news.cwru.edu>
Source record: 48859

Hey everyone. As much as I would like to say I use my Atari TT for almost all computing tasks, I cannot. I can't find an accpetable spreadsheet for this computer!

What I really need is a good graphing package. It has to be able to graph a whole bunch of different types ideally. I need this for some scietific plots. I'm not really concerned with the spreadsheet functions. Right now I have AtariWorks and Firstgraph. AtariWorks is pretty horrible when it comes to graphing. And Firstgraph can't seem to write metafiles and print to GDOS correctly.

Any spreadsheet I use would need to be able to use GDOS for graphing and printing. As I don't speak anything but english (and some spanish) well and don't have NVDI (ruling out GemGraph), I have few choices.

Now I did download the Texel demo and it seems very professional. But it's in German. And I can't seem to find a dealer with the English version of Texel. I'm not sure how the graphing works as I get some sort of dialog every time I try.

I also downloaded the XXL demo from OXO. This spreadsheet is a little odd, as I've heard in the past. But it's only available in French, so I can't really figure out what's going on in the program. It looks very promising, though!

SO have I missed some spreadsheets? I've also tried LDW Power, but that was not very good in my opinion. I really would like a professional spreadsheet for my TT. Does anyone have any input?

Or maybe could someone translate XXL for me ;-)

Just kidding...

Thanks!

Very scatty ground my friend. Papyrus is still in development, but it does
pose interesting questions re Speedo and AtariWorks etc. As Atari is NFG.

Which are the correct iso-8859-1 ASCII codes like they left my reader, so
obviosly no convertion was done. This is of course not important if you
stick to English, but for me an A vith a ring or two dots above are
compleatly different letters that actually appear at the end of the
alphabet (after Z).

>it's not a SCSI driver but a hard disk driver. It will never drive a
>streamer...
Well, it's just a way of speaking : the important is, that SCSITOOL
recognized all the devices, including the streamer, but HDDRIVER,
though seeing it, has problems dealing with it.

>Until now I haven't encountered a SCSI device not recognized by
>HDDRUTIL.
There must always be a first time. But it's over, now : since U. S.
sent me v7.94, all my drives are recognized again. And, for the
streamer, I'm going to try in a couple of days.

3643. Low End Mac has page on Atari ST/Magic Sac/Spectre GCR!

Newsgroup: comp.sys.atari.st
Date: 2001-03-15 14:35:54 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <dreibel-91DA57.09355315032001@quark.idirect.com>
Source record: 48754
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.mac.advocacy

Good grief, an unlikely web site has written up nice things about the ST!

Low End Mac, a well-known and respected source of information and daily news for Mac users of all stripes from the original 128K models to the current Cube and iMac models, has dedicated a page to the Atari ST and related models, giving specs and even some links to Atari resources like Hallvard's Quick FAQ.

Why? Because of the fact that during its heyday the ST could, with the help of David Small's Magic Sac and Spectre plug-in modules and software, do a more than adequate job of emulating a Macintosh, and for less than what a real Mac cost at that time. :)

Check it out and see what you think - it's at http://lowendmac.com/clones/atari.html . Might not be a bad idea to contact Dan Knight, the owner/maintainer of the site, and give him some positive feedback as well as any suggestions to improve the info on the page.

One can't help but thinking that The iDiot Forever Known As Sinclap will need a change of underwear after taking a look at this site - especially as it defeats his one-man campaign to denigrate the ST, as well as all 68K Macs still being happily and productively used daily by their owners, as "junk". There's a lot of great links there on software, hardware, upgrades, etc, that'll keep those Macs running long into the next few decades. Will TiFKAS now start a disinformation campaign (complete with character assassination, long rambling diatribes against imaginary "jihads" who are "out to get him", and poor spelling) against LEM now and shoot more holes in the foot which isn't in his mouth ? :)

Hi Andy,

Well, it's good to see that I am not alone.

It is so disappointing to see such abusive remarks being posted again.

I really should not need to block certain users as they may have a valid
point in the future. But to be honest, I probably don't have much choice.
I do not wish to read such posts as the one posted 14/03/2001 @ 18:49.

Sir,
If you have such a strong point to make please "SHOUT" in capital
letters. You do not have to show your ignorance of the English language
by using four letter words that are not required.

Please, before any abusive posters make a comment, I already
know that Usenet rules allow such things but my point is that
this is a computer group and not an adolescent one.

Many thanks.

"HAPPY"
Smile at the world and the world will smile back.

BTW. I have meant to ask for a while where is a good place
to obtain a new Floppy drive for my TT. I tried one from a
PC shop but it didn't work. I was afraid to ask the group as
I would not like to be the instigator of round 76 but the noise
is really bad. Only reasonable responses please.

Thank you.

Most PC floppies are hard-wired to work as Floppy B. There is a
way to modify those, as explained in The Quick ST FAQ (or was
that on Hallvard's Launchpad?).

I am minting my falcon, and am experiencing problems (no joke!)

To start out, I grabbed the freemint binary and the ext2fs and figured I could unpack the rest of the tools (which require long filenames) once I had my linux partitions available I could unpack the rest of the MiNT files.

Well, #1: if someone could explain why I need to purchase HDDRIVER7+ instead of using ICD 6.5.5... I would appreciate it. The docs say the driver needs to be XHDI 1.2 compat... ICD website says it is <shrug> MiNT does say that it ISN'T XHDI compat. What gives? How do I tell it to look at the ext2fs partitions?

Then we goto the other issue. I got it (following the MfL instructions, comments inthe mint.cnf and some guesswork) to boot so long as I told it to boot normal ROM GEM. (Ie., don't replace the AES, &c).

The neat thing is: the applications I had pasted to the desktop (in Newdesk.inf) run just nicely. I cannot run any programs in any desktop windows! They all look and act just as if they were inf or txt or nothing important.

As far as I can tell, I am folowing the docs. I'm not running any of the patches normally loaded under TOS (fpatch2)... Any ideas?

I am an ... um ... student

I'm actually surprised that there was a special TT version of the
dongle. One of our former TAF presidents used to use Logic on his TT
with the LOG3, and it worked OK except for the fact that he had to wedge
something under the dongle to insure it stayed in. Perhaps the TT
version may be designed so it would fit in a bit more snug?

> at the ext2fs partitions?

Well, first get rid of ICD. It has some minor trouble with Mint. I personally use CBHD, which is free, fast, and is fully XHDI-compatible. Works great on my Mint setup. Second, you now shouldn't need to set up a Minix partition anymore. In fact, here's what I did to set up my Mint system (very basic):

1. Get the newest Mint binary release.
2. Put it in the AUTO folder, named as MINTNP.PRG.
3. Create a C:/MINT/ folder.
4. Put in a very basic MINT.CNF file which is taken from the binary release, and editted down to only the basic things I need. This includes setting up the VFAT partition variables as described in the file itself, and setting the AES path. That's it.
5. Reboot.

If I can get my Falcon fixed, I could even get the MINT.CNF file and send it to you to make this as plug-n-play as possible.

> Then we goto the other issue. I got it (following the MfL
> instructions, comments inthe mint.cnf and some guesswork) to boot so long
> as I told it to boot normal ROM GEM. (Ie., don't replace the AES, &c).

This won't do much for you, as you then loose most of the functionality of Mint. Use AES 4.0 or 4.1 if you want to use a GEM environment (put SHELL=C:/path/to/aes/NAME.PRG for your AES at the end of the MINT.CNF file).

> The neat thing is: the applications I had pasted to the desktop (in
> Newdesk.inf) run just nicely. I cannot run any programs in any desktop
> windows! They all look and act just as if they were inf or txt or
> nothing important.

The GEM in ROM doesn't recognize lower-case filenames. You probably noticed the lower-case in the window? Your custom desktop icons have the names stored as upper-case, which is why they work. Try renaming the lower case file names to upper-case and they might work. Using an AES (AES 4.0/4.1, Geneva, NAES, XaAES, or oAESis) that can recognize the lower-case filenames fixes this.

> As far as I can tell, I am folowing the docs. I'm not running any of the
> patches normally loaded under TOS (fpatch2)... Any ideas?

First, what are your goals? If you just want a Multitasking OS with long filename support (my goal), most Mint distributions make it way too complicated. Like I said, I just have Mint in the AUTO folder, an AES (I use both AES 4.1 and Geneva) in its own folder, and a MINT.CNF file about 5 or 6 lines long in the Mint folder. Really easy. No special partitions (TOS partitions are automatically converted to long filenames without losing any data or software), no long install process, nothing. The most complicated thing I had to do, was to figure out which programs needed to run before and after Mint.

Hope this helps!

Mike Freeman

I was just as amazed that Dan Knight did that - I just happened to be
on this morning and saw he had it up as "clone of the day". He has had a
small page on the STacy on his page for at least a year. He's a class
act, and his site was instrumental in making my decisions what to buy
Mac-wise - lots of great information, and the contributors to his site
are a great read.

I wouldn't mind maybe suggesting adding some system specs to his
page, like the Mega ST, Mega STe and TT (could the TT run Spectre GCR?)

> But for me, the looser doesn't even exist any more. He's nobody.

talk about it - even some of the guys in comp.sys.mac.advocacy
realize that he's a weiner and an embarrassment to the Mac community,
after he tried to pick a fight with me in that forum last year a couple
of times. The resident satirist there, Dr. Robert Fovell, has even gone
as far to say that c.s.m.a should set up a donation to buy sinclap a
WinTel PC and a pair of mirrored glasses with the mirror side inward so
he can just get on with what he really is - a Wintroll using the wrong

platform :)

Hi,

> 1. Get the newest Mint binary release.
> 2. Put it in the AUTO folder, named as MINTNP.PRG.
If you use newest binary, you will run into trouble when only renaming
MINT.PRG to MINTNP.PRG. In new kernel versions memory protection is
switched off by using the boot menu, which you can get by holding down
the left SHIFT key, when MiNT starts.

Bye

Marc-Antï¿½n

3672. FS: More Atari! Preferred Customer Discount!

Newsgroup: comp.sys.atari.st
Date: 2001-03-16 07:50:04 UTC
From: Bravo Sierra Computers <atari@pacifier.com>
Message-ID: <Pine.BSO.4.21.0103152340320.29126-100000@shell.pacifier.com>
Source record: 48751
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.marketplace
Body handling: HTML body converted to readable text

e-mail: atari@benjamin.net

Lately I've added more Atari inventory so checkout my Catalogs. Even my 8 Bit Atari Software grew by 25%! And I'm offering a 20% Discount to my regular customers! E-Mail for Details on Redeeming this offer! I'd like to say Thank You for letting Bravo Sierra Computers Support you & your Atari Needs. And if you have'nt bought from Bravo, Give Ben a Chance! I can be quite Beneficial. And remember, if you can't come see me today? Come see me tomorrow! E-Mail or call Ben anytime at (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Indeed, and that was a _very_ stupid thing to do, given how many
documents refer to renaming the binary to change the protection.

3674. Crazy Dots problems resolved (nearly)

Newsgroup: comp.sys.atari.st
Date: 2001-03-16 10:43:20 UTC
From: Mark <mark@recycledsteel.co.uk>
Message-ID: <984739488.3649.0.nnrp-14.9e98a620@news.demon.co.uk>
Source record: 48770

As some may know I have been having numerous problems with my Cray Dots card in my TT, well I have for the first time got it working.

The other day I received my software updates from Atari Workshop (NVDI 5, HDDriver 8 and Magic 6), I installed NVDI and with a few simple steps it worked fine, 800x600x32K - no problems.

Magic 6 frames finally worked (no one said the colour depth could be the problem) and in general the desktop looked much more colourful and impressive, Doom using the VDI actually work and was slightly quicker, although still unplayable (really need a TT upgrade).

Anyway, I still have some questions;

1) The Redirect program does not appear to do anything, I get no redirection and have to guess may way around SELTRES (or whatever it is), should I not get all of the boot sequence after the Redirect prog has run (it is the first in the AUTO)?

2) Viewing documents in TOS just produces funny graphics on the screen, is this related to the above?

3) Why did the program select 62Hz when I told it the monitor worked from 65-75?

4) I selected a Crazy Dots VME card but it said the hardware was not responding, is this normal? Could I have a CD II card? How do I identify it (I know it has a 15Bit extension)?

Mark.

(before anyone says I know I was using Magic6 before I had bought it, my brother and I have been buying Falcons, TTs, Megas, etc and have accumulated software, this included M4, 5 and HDDriver 6 there was also what looked like an illegal version of HDD7 and M6 - we have purchased them now)

Yup, so does Cubase, in fact both look pretty good on most, but not all, 15"
and up SVGAs.

> This is good only for ST Hi-rez and no sound

If you need sound, for the pings and dings, when ordering an adaptor cable
from
Keychange, 01925 266120, for STFM users I will add a sound out lead.

STE users can take the sound from the stereo outs under the ON / OFF switch.

Barrie at Keychange.

Well close but the other way round,

I want to see if I can upgrade the AT Speed card I have in my Falcon to a 386 so that I can run Workgroups, NT or 95 on it.

It has a Siemans 286 chip which looks to be the same size as all other 286 chips (i.e. I imagine it is pin for pin compatible), it is not in a socket. I do remember some years back installing 486 chips in 386 PCs, these simply "piggybacked" on top of the 386 chip (not really secure but worked) and then a small program would switch them on, does such a thing exist for the 286?

Mark.

I'm guessing that the demo is V2.20, so I think you'll be unlucky?

Unfortunately DDP Translations spent a lot of time preparing a "proper"
English release of the to-be-forthcoming Texel 2.30, only to find that the
author had dropped support for it after agreeing to compile this version.
The issue being that there is a lot of text compiled into the binary.

What's the problem? If the activity light on the drive then chances
are you have the plug around the wrong way, as the original drives in
the TT are different to PC ones. You'll need to change it to ID0 as
well, sometimes a jumper, sometimes a solder pad. Also called DS0 on
many drives. PCs require DS1 you see.

Huh? How will that work. I'd be supprised as Windows 95 will chuck
up errors when it try's to detect hardware. Anyway don't bother on a
386, not even a 486. Use 3.1, helluva lot better (and stable).

There was an OS that plugged into the Cartridge port of the ST/TT, etc it
was Multitasking and was written 100% in assembly. It was NOT TOS/GEM
compatible and it had its own set of programs, the cartridge also meant that
it could boot directly just as TOS does.

Sorry I forget the name.

I do have one. It's a NE2000 card.
The box says SN3200 and supports window$.
It's 10BASE-T and 10BASE2 card with RJ-45 and BNC connectors.
>
> I know need an ne2000 card for the driver to work.
>

Getting such a card is maybe easy, getting the Hades drivers for it is another story.
The driver is written by Torsten Lang.
http://www.TorstenLang.de
email: tlang@dialup.becom.net (I don't know if this address is still good)

To get the driver you need to send him the Hades TOS serial number.

The only person I know who sells these cards is Axel Gehringer of AG Computertechnik (Memmingen Germany). Unfortunately it's almost impossible to contact him.

HTH,
Martin

Sorry I can't help you with the other questions.
You can get around you're last problem by using a replacement desktop
such as Thing. I don't know the reason for this behaviour. Anyway using
MiNT without a good replacement desktop is like driving a Ferrari with a
2 CV engine.

It's maybe stupid but IMHO it's far more stupier using such a OS
without reading the docs. It's all explained.

You should ensure that the ID is changed from ID1 to ID0 (or it may be
vice-versa), but PC drives are the opposite of what is required for
Atari's.

Why use the name 'Happy' when youre one of the most miserable gits on the planet, has anyone suggested anti-depresants, in large amounts!!.

You've appeared out of no-where and decided things dont suit you, the simple answer to that is sod off again.

Ref your thread on garbage, i only see you discussing this so far. As its not Atari-relevant, perhaps you'd like to take it to somewhere where it is.

> We have cable modems coming soon to my area, and an ethernet card
> is required.

I do have cable network right now but as Telenet (the Belgium company
who offers cable network) works with dynamic IP addresses and AFAIK
there is no driver for it on the Atari I've bought me a second hand Mac
G3. Now I'm trying to share the connection. I'm been told that this can
be done by means of Network Address Translation (NAT). So far no luck to
get my Hades back online.
I hope I'll be able to do so very soon as I'm getting sick and tired of
working on the Mac.
So if any of you have some info please let me know.
On the Mac side I'm (trying) using IPNetrouter. The cable Network is
connected to the internal ethernet card. On the second ethernet card
hangs the Hades. On the Hades I'm running MiNT-net.

TTFN,
Martin

>I've needed.

I only have a 14Mb Falcon with Nemesis & FPU nowadays. It shares a
SVGA monitor, Cherry keyboard, HP printers (2) and modem with a P133
Wintel machine.

Unfortunately I need the Wintel for online stuff and file
exchange/work with non-Atari owners.

It's a change from when I had 4 complete Atari systems in the house!

Still much prefer using the Falcon for DTP and WP!

Best wishes
Mike Kerslake

//
// > I am minting my falcon, and am experiencing problems (no joke!)
// >
// Well, first get rid of ICD. It has some minor trouble with Mint. I
// personally use CBHD, which is free, fast, and is fully XHDI-compatible.
// Works great on my Mint setup. Second, you now shouldn't need to set up a
// Minix partition anymore. In fact, here's what I did to set up my Mint system
// (very basic):
//
I'll give cbhd a shot, then. Kinda disspointed that MiNT isn't compatible
with ICD.... Says it is! Shoot the people that said so! <grin>

I found the latest stable (or so they said) from the sparemint page
(wh-58-508.st.uni-magdeburg ....), which would be 1.15.5. I can mess with
getting a new version once I get the ball rolling--and understand what teh
he11 is going on.

As for the mintnp.prg,the sparemint dist had a mintnp.prg & a mint.prg
(which they said rename to 030, if you wanted to take advantage of the 030
routines, but didn't say about making it *np.prg to do
not-protected.) I tried my last minting last weekend, but I just dropped
the *np.prg in instead of using the *030.prg just to get the machine
started.

I may have had the paths set wrong..... I'm not at all clear on which
variables go where, and had 1 hell of a time figuring out (and so I left
it commented out) how to deal with the newfatfs var. It didn't seem
appliciable since the notes in the conf file seemed to mean to not include
boot partition, and i figured that I could do long-filename stuff in my
mostly unused linux/68k partitions.

//
// This won't do much for you, as you then loose most of the functionality of
// Mint. Use AES 4.0 or 4.1 if you want to use a GEM environment (put
// SHELL=C:/path/to/aes/NAME.PRG for your AES at the end of the MINT.CNF file).
//
At some point i found aes 4.1 and tried it.... damn thing barfed. I'm
glad I have kept my linux partitions bootable--I'd have never been able to
boot again! (Not quite true, cos I did have boot disk with HD driver
software ... but linux was easier)

I'll try it again with modified shell variable.

// The GEM in ROM doesn't recognize lower-case filenames. You probably noticed
// the lower-case in the window? Your custom desktop icons have the names
// stored as upper-case, which is why they work. Try renaming the lower case
// file names to upper-case and they might work. Using an AES (AES 4.0/4.1,
// Geneva, NAES, XaAES, or oAESis) that can recognize the lower-case filenames
// fixes this.
//
I did notice the lower-case filenames! I liked it, but Im surprised that
TOS/GEM/&c would be case-sensitive about it! Very strange....

// First, what are your goals? If you just want a Multitasking OS with long
// filename support (my goal), most Mint distributions make it way too
// complicated. Like I said, I just have Mint in the AUTO folder, an AES (I use
// both AES 4.1 and Geneva) in its own folder, and a MINT.CNF file about 5 or 6
// lines long in the Mint folder. Really easy. No special partitions (TOS
// partitions are automatically converted to long filenames without losing any
// data or software), no long install process, nothing. The most complicated
// thing I had to do, was to figure out which programs needed to run before and
// after Mint.

Well, it isn't just multi-tasking that I want. I have Magix, but have
always been a bit dissapointed. Maybe it it that all the serious/fatal
error dialogs are still German, or the file icon supprt feels clunky, or
something, (hey, it might be that I am just one of those wierdos that
actually like the TOS desktop, and mgxdsk doesn't feel enought like
it!!) but its something....

Well, that and MiNT can do recompiles of linux-ware and still be TOS-prg
compatible. I like linux, but i have to reboot to use phasar, and since i
figure linux 0.97pl3 is a little old, i'd do better with a better than
clab mk2 standard HD.

Variety of reasons, but the ability to run many linux recompiles and run
the nicer atari prgs (without the mag!x -erm, issues) is the best reason I
can vocalise.

//
// Hope this helps!

YES!

Thanx.

A bend in the road is not the end of the road...

Best way is (was) the Ethernet Romport Interface from Elmar Hilgart.
Iï¿½m not sure he had someting left.

I use this interface by me self. My falcon is connected to an home LAN
and via hardware router to internet also. Works fine. Filtransfer from
one to another machine is done by FTP server/client software.

All URLs can be found on my link site on hardware and/or communication
part. http://www.doitarchive.de/link.htm

DOITST contain all what i know about how to connect an atari to LAN.

> and if a FPU is needed for running it? Same

Yes, needs an FPU and an DSP. The point why APEX is falcon only.

> question about NEON? Does the Falcon version ned
> a FPU. AFAIK it does but I'm not sure.

Last german sale point for NeoN was Falke Verlag.
NeoN also use the FPU.
Watch the different falcon and TT releases of NeoN!!
Maybee the falcon release woni¿½t work on TT.
TT release woni¿½t run on falcon.

My NeoN falcon needs an dongle for the lan port.

I doni¿½t know about any other info. That the last i know.

Mario Becroft's Atari Hardware Products
http://gem.win.co.nz/mario/hardware/midi3.html

MIDI-3: The 3 MIDI output expander for Atari ST

MIDI-3 is a 3 MIDI output expander for use with music sequencer programs
such as Notator and Cubase on Atari ST computers. It is completely
compatible with the C-LAB EXPORT (which is no longer available) and connects
to the computer's serial (modem) port.

Features:

Provides 3 exra MIDI outputs on an Atari ST or compatible computer.
Connects to the serial (modem) port.
Fully compatible with C-LAB EXPORT.
"Plug and play" operation.
Requires no external power supply or other connections.
Available cased for external use, or uncased for mounting inside a recased
Atari ST.

MIDI-3 NZ$ 110 (Price in New Zealand dollars)

Three MIDI port expander KIT for the Atari ST/STE (not Falcon)

When the original MIDI specification came out in 1982, 16 MIDI channels must
have seemed like
a lot. Especially when synths were the price of a house or car.
However, these days, even a £100 GM module can utilise all 16 MIDI channels
(whether you
want it to or not) and there's also a plethora of MIDI controlled devices

too. Like MIDI controlled audio
and lighting mixers, effects processors, and other MIDI controllable
gadgets. Quite simply, 16 channels is
no longer enough, even for a modest two synth system.
Enter Noboxe 48, which means you can hang each (or more) 16 channel device on one of it's
ports (and the original Atari port too) and not have to worry about turning channels off, or sounds
layering when you don't want them to. Also reduces MIDI delays due to daisy chaining.

Three MIDI port expander KIT for the Atari ST/STE (not Falcon).
Connects to the Atari's serial Modem port.
Steinberg Cubase MROS driver provided (emulates Export for Clab/Emagic)
KIT FORM (requires soldering) for incorporation in to your own RACK case or preffered housing.
Reduces MIDI time delays through daisy chaining.
Provides up to 64 MIDI channels (including original Atari port)
MIDI activity LEDS per port
Powered off a PP3 battery or a DC 9V mains adaptor (option for joystick port powering also available)
Kit only £39 inc. VAT (plus £2 Europe carriage £3 ROW)
See above for ordering contact details (including CardCrypt for Net payment).

I hope this informations interesting you ...

Regards ...

Paul.

FamilyNet Newsgate

Have a former Atari user here in the Dallas area trying to sell some
equipment. Thought the PC-Ditto part of it all was kind cool. If interested,
write Rick and make an offer!

Doctor Clu - One of the co-ordinators for Dallas /Atari activity

@>-->-------------------------

I have a 1040 ST with an SC 1224 monitor. I cannot classify myself as
an Atari user anymore. I have long since surrendered to Bill Gates, et all.
After years (10?) of inactivity, I fired it up before Christmas when my kids
returned home. It worked like the day I took it out of the box. My wife was
doing some spring cleaning/rearranging/throwing away and I thought it would be
much better to get this Atari to someone who would appreciate it and use it.

In addition to the basic stuff, I have a few games such as:

Micro league baseball, Indiana Jones and the Last Crusade, Zany Golf,
Flight Simulator, PC Ditto, Mean 18 Golf, The Pawn, Mavis Bacon Teaches Touch
Typing.

$100 for the bundle.

If interested contact "Rich Kernan" <richkernan@home.com>

3714. DI Mega Images are coming ....

Newsgroup: comp.sys.atari.st
Date: 2001-03-17 14:53:59 UTC
From: ebaiz@skyenet.net
Message-ID: <bUKs6.92$Mh1.2053@newsfeed.slurp.net>
Source record: 48799

Hello all,

The Mega DI images will be coming soon. I have all the files extracted
from the ATR mega images which can be found at: http://atari.webjump.com/atari0.html.
I used a program for Windows (had to use my wife's PC) which can be found
at: http://home.columbus.rr.com/ksiders/atari.htm. Now all I have to do is
to put them together. I need to have a DI image of MyDos 4.5. I have to
make it A friend of mine is bringing over a copy of it on an 8-bit disk.
I just need to load it into the 8-bit computer and then hook up the 8-bit
to my Hades and then tell MyDos to format a disk and put the DOS files on
it. Then the image will be made.

Having the MyDos DI disk, I can then format some big disk images and put the
file into the them. If this does not work I can always to a regular format in
high density using 800XLDJ. I will have to create two disks for each ATR
mega image file. There are 22 ATR mega images and all but the last 2 or 3
have lists that can with them.

I have already tested things out and everything seems to work. You need to
remove the basic in the XE in order to get some games to work. You really need
MyDos to load some of them because of the length of some names. There is also
a program where the ATR mega images can be found that is some sort of a
disk directory loading program. I could not extract the files from this atr
file, so if anyone has an 8-bit program that will bring up the directory of
an 8-bit disk and load the programs on it, please let me know. I could create
a DI image file of it and include it in the Mega DI images I am creating. Of
course I would just need theraw 8-bit files.

That's it so far. Any questions, comments, please email me or leave a message
on this User's Net...

Hello Joshua Kaijankoski and some others!

I have twice sent you some PD Atari-stuff you asked for, but both your adresses caused returned mail!
I now will wait untill you asure me to have a working adress. It is a limit for my helpfulness too!
Fortunatly I have got Popwatch so I can delete returned mail on the server without having to download it.
But then I have to use Sting instead of Iconnect for dialing.

Why is it quite impossible to use Atariicq, Popwatch, Nwatch etc. when you get a connection throug Iconnect?

By the way: Cab is working best for me when I am using the original .ovl and Iconnect!
Anyone had the same expierience?

I will not give any of the modem port MULTI out midi expanders floor space,
never mind attach them to my Atari.
The single output cables may be OK for data that is not timing specific,
e.g. effects unit prog changes and pads but the problems with midi timing
customers using the MULTI out boxes have described to me are on a par with
PC midi timing.....

> Mario Becroft's Atari Hardware Products
> http://gem.win.co.nz/mario/hardware/midi3.html
>
> MIDI-3: The 3 MIDI output expander for Atari ST

I have not tested this box so will not comment, reports please when using
all three ports at the same time with a heavy data flow / multi channel use.

> Noboxe 48
> http://www.padworld.demon.co.uk/dnarm.html#Noboxe
>
> Three MIDI port expander KIT for the Atari ST/STE (not Falcon)

I supplied a few of these as kits and built up.
None worked satisfactorily for my customers, I ended up binning them.
Poor timing, hanging notes, miss triggering of samples. In my opinion pretty
useless.
Again, reports please.

The dongle port expanders are my preferred option, the timing accuracy is
well worth the extra expense.

Comments?

Barrie at Keychange.

>get my Hades back online.

My ADSL provider also only give me one dynamic ip-address through DHCP
and also requires a non standard login procedure via a javascript
webpage. If there is no traffic for some time (1 hour?) I get logged of.

I first solved this with an old Win-95 pc with Ethernet to the ADSL
modem, NAT software on the pc and a nullmodem connection to the rest of
my (Ataris with STinG) network. This worked fine and by simply have
Popwatch check for mail every 1/2 hour I almost never got logged off. A
minor problem was (and still is) that STinG becomes unstable on the
computer running Popwatch ater a couple of days due to "STinG internal
memory" fragmentation.

When I got the Ethernet adaptor for the Atari ROM port I bought a Netgear
RT314 "broadband router" with built in switch, NAT and DHCP client and
server. Works perfectly and was almost "plug&play" on the Atari side.

The Netgear is fully compatible with STinG and Atari in general except
for some javascript in the "web interface". But this is really no problem
as it works fine to configure it via the telnet client Telstar.

For simple use (one pc and one Atari) I did not have to change anything
in the Netgear router = true plug&play. The router acts as a DHCP client
and fetches the ip-address from my isp. It then acts as a DHCP server on
the local 192.168.n.n network and the pc gets its local address
automatically.

I have assigned the Atari a static address outside of the router DHCP
range (192.168.0.129) and this worked without any settings inside the
router.

I am also using another Atari TT on a nullmodem subnet network with the
first Atari (with Ethernet) acting as router. For this to work I had to
add static routes in the routing tables of both the pc and the Netgear.
So now all three computers can talk to each other and the Internet. The
first Atari runs the webserver and I use the second one for mail/news/web.

Whenever I get logged off (has happend a few times when the pop3 server
was down) I simply power up my pc, run MSIE5 and login again. The rest of

the time only the Netgear router and the Atari running the webserver is powered on.

>I hope I'll be able to do so very soon as I'm getting sick and tired of
>working on the Mac.

Unfortunately I think Mac is inferior to pc handling networks?

>So if any of you have some info please let me know.
>On the Mac side I'm (trying) using IPNetrouter. The cable Network is
>connected to the internal ethernet card. On the second ethernet card
>hangs the Hades. On the Hades I'm running MiNT-net.

My recomendation would be to get a hardware "broadband router" if it's compatible with your isp equipment (it really should be!). Everything gets much simplier and you also get a much more secure (against hackers) setup. With a setup like that you don't have to run the poor Mac all the time and could retard it to be a simple (javascript!) webbrowser :-)

To get this variable to work all you need to do is add this to your mint.cnf file:

VFAT = A,B,D,F,G
NEWFATFS = A,B,D,F,G

where A, B, D, F, and G are the drives/partitions you want to use the VFAT file system.

You *may* need to run the TTP program that creates a vfat filesystem. I don't remember off hand, but I don't remember running, personally.

You can then easily turn any TOS filesystem (except the C drive) into a long-filename compatible filesystem. This way, even if you don't use it for your hard drive, you can let your floppy drive read PC-compatible long filenames on floppies.

> // This won't do much for you, as you then loose most of the functionality of

That's odd. AES 4.1 runs fairly stable, but slow, on my Falcon. What's your AUTO folder order? This was a pain in the butt to get right. When mine was out of order, no AES would run properly.

> // The GEM in ROM doesn't recognize lower-case filenames. You probably noticed

Well, when GEM was put into your Falcon, long and lower-case filenames
didn't exist, so they wouldn't have taken this into account.

Part of your problem is Magxdesk. I have Magic as well. Magxdesk really
stinks if you're looking for something comfortable and full featured. Thing
and Jinnee are *MUCH* better. Getting one of these will fix many of these
problems.

These are very good reasons for using Mint. With XGEM, you can also run
X-Window programs, which opens up a lot more possibilities. If you can,
though, try the VFAT filesystem. You may or may not like it better than your
Linux filesystem. Another advantage of the VFAT filesystem is that it can
still be read when using GEM without Mint and long filenames. The long
filenames are changed from "Long Filename.ext.prg" and "Long File Name
Also.prg" to "LONG_FI~1.PRG" and "LONG_FI~2.PRG".

Goodness! Might be easier to list what you DON'T have! ;^)

That would make the list much shorter!! Hehe...

As for me...

One Atari Falcon030, 14MB RAM, 1.2GB Quantum Fireball IDE disc,
1.8GB Seagate ST42100 SCSI disc, PowerUp2 (32MHz '030) accelerator,
FPU, a dead SCSI CD-ROM, 14" VGA and 13" Atari screens, 14k4 modem,
a Roland SC-7 sound-module.

One Atari 520STe, 1MB RAM, just the 720k floppy disc...

...and thats all folks...

I will have a faster FPU soon (64MHz?)

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

That is a cool site. I am a member of the Low-end-mac club and the
classic mac club for the simple reason that I used a Macintosh Plus for about
seven years, and the fact that I'm trying to find out all the Spectre GCR can
do within the System 6.08 confinds that I have found it has.
Still, the Spectre is a wonderful add on to the ST!

I need to get Dan Knight to add my Spectre resource page (which I add to
every so often...)

http://www.geocities.com/clu-da-bard/spectre.html

Check it out. Let me know what you think.

Talk soon,

Hi

I haven't seen this question asked so I thought I will :)

Is it possible to use DVDs on any Atari or TOS clone?

I don't have a clue what format they are in so I can't see if any
software would work with them.

It's the films I'm interested in, not CDs with programs on.

Surely a Hades/Milan can do this?

Dan,

Great to hear from you!! I know that back when I was in AUNT (about a year
or so ago) all I ever heard about was Geneva this and that. Been using a copy
of Neodesk and like it. May have to give Geneva a try in the future. :)
Heard its a pretty good multitasking environment that should work well on a 4
meg 1040ST.

Anyway, I've spread this message to the JYBOLAC and fido.ST areas as well.

Well I can say from experience that Spectre GCR 3.0 runs wells on the TT. I really exjoyed it. It was like having a super fast Macintosh Plus. I guess it would have been a Mac II maybe in equivalent. :)

EUREKA !! he cried, jumping out of the bath naked !
The missing piece of the puzzle !

I'm a big fan of multifunctionality. I presently use an ABCD switch -
box and one multisync monitor to run an AV Power Mac, an Amiga and 2
PCs. I have to use 3 keyboards and 3 mice unfortunately.

I have a VGA/TV box called a JDH Videomate which is also hooked up to
a Sony VCR. The Videomate will switch between computer input or its

own tuner/video control so I also use the SVGA monitor to watch TV or videos. The output from the ABCD plugs into the Videomate and inputs the selected computer signal.

The Videomate has RF inputs of either threaded cable connector or RCA audio and video. I feed the cable service thru the Sony VCR to it.

I've also used a Commodore 1702 and a VCR to double as an excellent TV or 8-bit monitor, so I know that a VCR works with them.

I have a Videokey and Monitor-Master which I've used mainly to switch between Atari Color and Hi-rez monitors.

It now occurs to me that I could input the Video-key output to either the VCR or Audio/Video RCA jacks on the Videomate as well as 8-bitters should I wish using a multi-video switch box.

Now that would justify the expense of a large Multisync monitor !!

Wunderbar !!

Thanks Larry

There was an adaptor cable years back (mine is buried among my Atari
stuff somewhere) called Monster Stereo or some such, which split out
the audio to 2 RCA leads from the composite signal to the monitor. It
had a program to combine the RF signal IIRC to produce L-R channels.

Bonjour :)

Rajah Lone, Daroou and Mateo invite you all to discover the new
release of DGEM 0.12, product of the french group Renaissance.

News since the first 0.10 version:
- new labyrinth
- Falcon XBIOS compatible sound routines.
- first wall and floor items (mostly ornementation)
- invisible pits, second wall texture
- iconification, desk background, bugfixes...

You can download it at http://www.multimania.com/nef or directly at
http://www.multimania.com/nef/files/dgem012.zip (300Kb).

Coming next: doors, wall inscriptions, switches and maybe teleporters.

Hope you'll enjoy our work :)

A bientot

Pierre

Surely an 060 (CT60?/Hades/Milan) could do it, maybe not as good a PC,
but if we had a program that did do it, then this would force poeple to
make faster hardware to keep up with the pressure the software is
putting on the computer.

Or am I wrong? This is the way PCs move on.

I think it has been Pera Putnik who posted in c.s.a.st.tech an URL for some
GAL/PAL docs quite some time ago. On that site (seems I don't have the
address anymore) I picked up a document describing how to build a simple
parallel-port GAL programmer (not that I did made one):

> This document descibes how GALs 16V8/A/B/C/D/Z/ZD, 18V10/B, 20V8/A/B/Z,
> 20RA10/B, 20XV10/B, 22V10/B/C/Z, 26CV12/B, 6001/B, and 6002B from Lattice,

>
etc. etc. including instructions how to code one's own "programming program".

There may be slight problems with and Atari as the procedure requires some
data to be read from the GAL (programming voltage and pulse duration), so a
proper bi-directional parallel port may be needed.

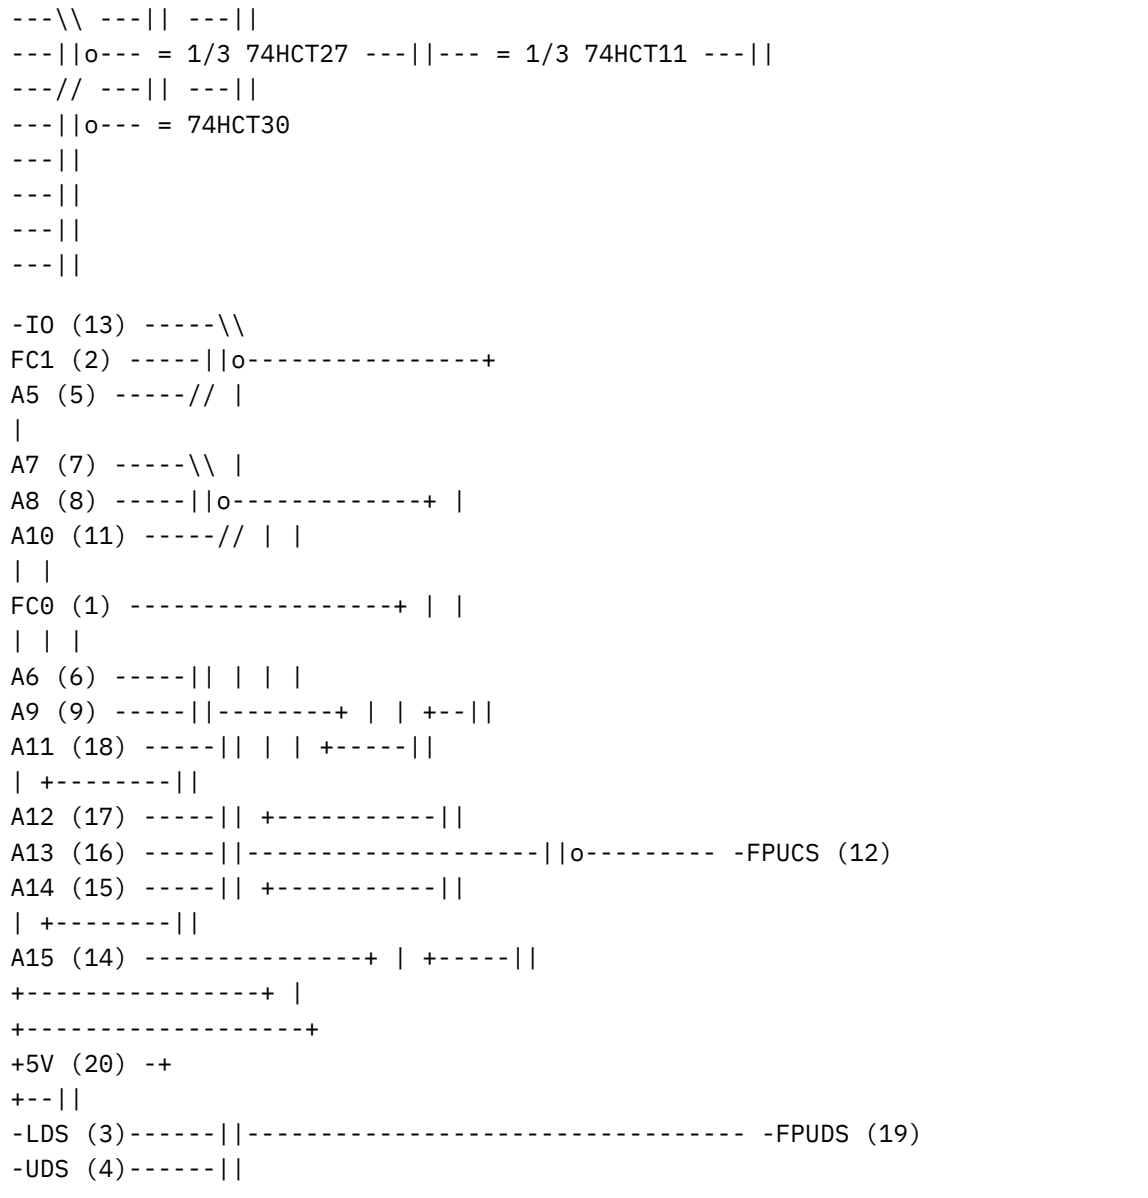
>> So you should be asking "is there a compiler for the Atari". I think I saw
>> something on a German site, but I don't have a URL.

Probably on ftp.cs.tu-berlin.de; look for JEDI, there may be further info
in that archive.

On the other hand, the FPU-related programmable logic device in a MegaSTE (in fact it was a PAL) has to perform two relatively simple functions:

- decode address $FFFA40 for FPU "chip select"
- create -UDS .AND. -LDS for FPU "data strobe"

Apparently it may be simulated by three standard logic chips (74HCT27, 74HCT11 and 74HCT30), arranged on a little board to be plugged-in instead of a GAL. The logic below would probably do the trick (numbers in parentheses below should correspond to PAL pins):



I sketched the above schematics by adapting the one I used for putting a FPU in a MegaST. On a MegaST more address lines need to be decoded (A16-A23) which are, apparently, taken care of in a MegaST by the -IO signal.

cu.

There's no way a 060 can do this. Even the fastest (most optimized)
decoders on PC's needs atleast a 266Mhz PII or similar. A PPC-based clone
shouldn't have any problems though, as long as it has a fast bus.

However, a PCI decoder card that can talk directly to a PCI graphics card
should work fine on a Hades or Milan.

The problem is drivers. DVD-movies are encrypted and keys have to be
licensed. This is *very* expensive.

In message <98uc8i$4lj$1@plutonium.compulink.co.uk>, I said:

[Re: My Atari downloads]
>I wonder if we are going about it the wrong way somehow?

I've found the problem! I am still using my mono VGA most of
the time. Even in 256 greyscale, the My Atari menu bar is completely
black and you can't see the entries on it - at least not in the March
issue. I have now gone back with my RGB monitor in 256 colour mode,
and managed to download all. But I still think it would be easier if
the whole mag could be downloaded, preferably by email as that is
about twice as fast as using CAB and the internet. No doubt I am
slowed down as I can't use Nemesis on the RGB, so I only get 4500
bytes/sec download. On the mono monitor and with Nemesis on Cix I get
10000 chars/sec regularly.

Regards, /Peter/

Ok for the movies point of view. But DVD is not just for movies, even if
it looks to be the most popular. It would be great to have a support at
least for data, I mean for "plain" DVD-Rom. DVD is "just" an extended CD
or did I missed anything ?

Bye,
/Pascal/

DVD's use the UDF file format...The same format that is used for CDR/CDRW's
that have been written to using packet software like DirectCD. If the
ST/TT/Falcon line has a UDF File System driver then it will be able to see
the files on DVD-ROM/DVD-Video discs (still wont play the video though)

My opinion is to not spend too long trying to get ST software to work
on it. I personally think that the best option is a TT clone, but
with a DSP. I would have to be able to run Falcon programs that use
the DSP, but have the stability of a TT, along with a VME for the
Galaxy. Built in midi expander too, as it's so easy to implement in
the design, you'd be stupid leaving it out.

HD-Driver supports DVD AFAIK, but I'm not sure if there's any support for
the DVD filesystem on our platform. It shouldn't be a problem to support
this under MiNT and MagiC though.

Date: 2001-03-19 21:56:02 UTC
From: Lonny Pursell <fatal@SYNTAX.ERROR>
Message-ID: <Pine.MNT.4.10.10103192153390.90-100000@Hades060>
Source record: 48707

Anyone have a Mach64 PCI video card they wish to unload?

Or possibly know where I might find one?

Thanks...

Lonny Pursell atari AT bright DOT net www.bright.net/~atari/

>

As to the encryption, thats just about 6 lines of PERL though ;)

There is a program for Linux that allows you to view DVDs across a network. Similar to an X server I believe. All the work is done on another machine and the local machine just displays the video. At least this was my impression of how it was supposed to work from the 30 seconds I glanced across the page out of curiousity.

I did try 3D-Calc+ and it was pretty good. I could deal with the lack
of GDOS support. But it didn't have enough graphing capabilities. It
could only draw a couple types, if I remember correctly. Not too
shabby as a free offering, though!

I meant to mention that you only have the choice of the original overlay or
Olivier Booklage's, Dan's one will not work with an IConnect connection
(unless you've installed Ifusion).

>Now I am beginning to think that my computer perhaps acts normally.

I prefer the original overlay because it quickly identifies on- or off- line
mode, and allows me to browse cached files without irritating dialog boxes
and timeouts! :-)

>planet, has anyone suggested anti-depresants, in large amounts!!.

I can see why he is complaining.. Seriously, I think noone
appreciates being threated without respect. One thing is for sure,
this forum will not benefit from it in any way. Let's all just at
least pretend we are adults here..

>You've appeared out of no-where and decided things dont suit you, the
>simple answer to that is sod off again.

The fact he is new to the group doesn't mean his posts should be
ignored IMO. If you ask me he has a point. Since I have been
reading and posting to this forum for some time perhaps it is okay for
me to give my 2 cents? I think "Happy" indeed has a point.

>Ref your thread on garbage, i only see you discussing this so far. As its
>not Atari-relevant, perhaps you'd like to take it to somewhere where it
>is.

It is about this forum and thus should be okay to post here. There are
however a lot of really far fetched threads going on every once in a
while that has absolutely nothing to do with even computers.

Regards,

Joakim

>in that archive.

Jedi is the Boolean-Jedec file compiler, Gabi (made by the same team)
is thesoftware that drives the hardware and burns the Jedec file into
a GAL.

I've yet to use mine, due to switching to the Falcon, and the fact
that I never found any good documents on how to program boolean. the
actual expressions I can work out, but it's the cryptic parts at the
top which baffle me. Seems to set out what pin is for what. And I
can't see how to design a flip-flop in one either, just by using NOT
and AND.

Anyone help? I'd like to use it for an upcoming project. Djordje, do
you have a Falcon?

Hey?!

Are you using a 56k modem? The best I can get is 3600 bps in CAB, and
probably just 4000 via GapFTP. This is with accelerator as well.
Whenever I move my mouse or especially if the screensaver kicks in,
the Rx/Tx lights conk out and most of the time they never pick up.
Resulting in a corrupted, half download. This is on a Falcon BTW.

Sometimes I use the option in CAB 2.7 to switch off document settings
and use my own black on white setting, for difficult to read sites.

3798. Re: MiNT and running prgs

Newsgroup: comp.sys.atari.st
Date: 2001-03-20 18:04:42 UTC
From: Dave Parsons <parsonsd@wam.umd.edu>
Message-ID: <Pine.GSO.4.21.0103201214100.23981-100000@rac2.wam.umd.edu>
Source record: 48732

On Sat, 17 Mar 2001, Michael and Nicole Freeman wrote:

// To get this variable to work all you need to do is add this to your mint.cnf
// file:
//
// VFAT = A,B,D,F,G
// NEWFATFS = A,B,D,F,G
//
After this (and running through thing), it seems to find longer
filenames. I did note that a long w95 filename wasn't findable in the
standard GEM window... Upon some thought, that doesn't seem so
surprising.

//
//
// > // SHELL=C:/path/to/aes/NAME.PRG for your AES at the end of the MINT.CNF
// > file).
// > //
// > At some point i found aes 4.1 and tried it.... damn thing barfed. I'm
//
// That's odd. AES 4.1 runs fairly stable, but slow, on my Falcon. What's your
// AUTO folder order? This was a pain in the butt to get right. When mine was
// out of order, no AES would run properly.
//
I should point out -how- MiNT panic'd:
It qould be fine with reading the script, but when came to loading things,
the machine would get to trying to use
GEM=u:/boot/mint/aes/gem.sys
would cause the machine to reboot. There was an error messag, but it
dissapeared into the reboot that I can only say, "I Think it was error
222."
Similary, when I found XaAES, and placed it into my aes directory, it MiNT
would panic the same way. Think that error was 223. Again, it would
reboot. I am sure of the directory structure.

When I tried using SHELL as the var you had in the example above, in the
message (again brief, as it immediatly changed the screen to load in GEM),
MiNT complained about SHELL not being a var it understood, and would
therefore ignore it.

Couple of questions then:
= Should I be using / or \ between directories?

= I finally guessed right about getting MiNT to preload thing: instead of
making it load from [u:/boot/thing/thingrun.prg], I had it load from
[u:/c/thing/thingrun.prg] (I -am- getting confused about these fw and bw

slashes now! :)) Whats the difference? I thought [u:/boot/] was by
default the same as [u:/c/]? Should I say, "What the hell" and try to
get MiNT to load the AES the same way I got thing to run? (Well, I might
say that over the weekend if I get all my work done over the week so that
i can play, but you understand....)

= Is there a place in the mint.conf script to tell MiNT to log boot
messages? Can I get MiNT to just halt when it panics so I can see the
error messages instead of it doing an automatic reboot? (Is that a common
problem?)

= Though thing was loaded, and I typed it into the script in lowercase,
should I be worried about case-sensitivty?

You asked about the autoloaded prgs from the auto folder....
Well, it does run icdboot.sys from the c: drive first, but from auto:
-alilo.tos
-nvdi.prg (prg? maybe tos... whatever it is, its nvdi 4.1...)
-mintnp.tos (v 1.15.5)
in that order. I trimmed a lot out of the auto folder when I realised I
was having probs.... *sigh* so much for powersave or maccel. In any
case, that folder goes back to auto.mnt when I need to run other prgs,
then out comes auto.tos or auto.mgx to auto...

// The GEM in ROM doesn't recognize lower-case filenames. You probably noticed
// the lower-case in the window? Your custom desktop icons have the names
// stored as upper-case, which is why they work. Try renaming the lower case
// file names to upper-case and they might work. Using an AES (AES 4.0/4.1,
// Geneva, NAES, XaAES, or oAESis) that can recognize the lower-case filenames
// fixes this.
// > //
//
Interestingly, though maybe not surprisingly, renaming doesn't do
anything. Thing recognizes them (and will load them), but GEM rename
doesn't help, so I am forced to run thing. Iguess that means I need to
figure out the regitration for it. (ooh, that and some other things...),
so I don't have to look at "This is Shareware!" splattered all over the
backdrop.

//
// These are very good reasons for using Mint. With XGEM, you can also run
// X-Window programs, which opens up a lot more possibilities. If you can,
// though, try the VFAT filesystem. You may or may not like it better than your
// Linux filesystem. Another advantage of the VFAT filesystem is that it can
// still be read when using GEM without Mint and long filenames. The long
// filenames are changed from "Long Filename.ext.prg" and "Long File Name
// Also.prg" to "LONG_FI~1.PRG" and "LONG_FI~2.PRG".
//

XGEM.... I remmber seeing something about this, I think. Sounded
interesting, and your description makes it just about required
material. I will need to search on this a while, creo.

When I get there, I still want an ext2fs on a few partitions, but VFAT
will be required for a:. Maybe for my BGM partition, too. But I need to
get things working reliably 1st, before I worry about d:.

"Sell `crazy' somewhere else. We're all stocked up here."

Hi Jeff. The best application for scientific graphs is (was) Off-axis that was sold in Germany although they had an english version. The bad part is that I haven't been able to find a copy in any language :(. The second best is Gemgraph that is extremely versatile generating very professional-looking graphs (better than any spreadsheet) with the possibility to export metafiles, and JPGs in the next version. This program is still supported by the author who has been very helpful when I have had some questions. My advice is to get this program and invest in NVDI, that should be easier to find than Texel in addition to be a great addition to your computer.

Daniel.

U-SCSI works fine on falcon. Transferrate is 1.8Mb maximum. Thatï¿½s one
of the falcon problems..

>top which baffle me. Seems to set out what pin is for what.

>And I can't see how to design a flip-flop in one either, just by using NOT
>and AND.

You can find logic design for flip-flops in most books on basic digital
electronics, I suppose. Two two-inputs NAND gates can make a RS flip-flop
(feed the output of each NAND to one of the inputs of another NAND; use the
remaninig inputs to Set/Reset). I think that four or five NANDs can make a
D-type latch. etc.

Btw. when I bought my present compter several years ago, I got with it a nice
little program, called DIGITAL, (V2.3, by one Erich Eder) for designing and
simulating logic circuits. Quite useful for finding the not-so-obvious
glitches in your designs, etc. (even though it seems I never succeeded in
using the program completely- no docs available). Anyone knows the fate of
that software? Available anywhere, last version, English version, freeware
or not, etc?

> Djordje, do you have a Falcon?

No. Just a MegaST4, a little boosted by a GEsoft SCSI-2 adaptor, a home-made
FPU board and a Lacescan circuit. Falcons were too rare and too expensive
here. And, in fact, I have never programmed a GAL in my life. Never got round
to making the programmer adaptor (the days get shorter as the time flows by),
or to finding the specs for the GALs (e.g. what is the standard delay time

through its gate?). Besides, electronics is not my profession- I'm an aerodynamics engineer.

Regarding the possibility of MPEG2 card, it shoudl be possible to get an Eclipse kitted Falcon to do this too, you'll need the dual board mod and someone has to write the drivers, but I've seen a fairly lowly 486 doing DVD via a decoder card and therefore if someone was willing to code it up for the Eclipse it would be possible...potential EU sales...about a couple of dozen I guess.....though I would be one of them...I expect that it would have to be tightly written to possibly a specific drive and board combination, and it would have to output via the Eclipse's Rage card....

Actually, I don't think this would be possible...

1. The Eclipse in it's current incarnation doesn't know about bus
arbitration, hence all traffic between PCI-cards must be done by the CPU
(or perhaps blitter).
2. According to Sven Karlson the Eclipse isn't any faster than the
Falcon-bus, so even if bus arbitration *was* supported, it would still be
much too slow to move uncompressed images to the graphics card 25/30
frames per second.

I don't know how fast the PCI-bus on the Milan and Hades is, but I believe
it should be fast enough for this if decryption is performed in hardware
too (is it? I don't have a clue.).

> someone has to write the drivers, but I've seen a fairly lowly 486 doing DVD
> via a decoder card and therefore if someone was willing to code it up for

If this is true then decryption is almost certainly done in hardware, and
if not the 060 should be fast enough to do it. But the problem is still
the same - licensing the keys is expensive.

Time to give my 2 cents I feel. I hope the above was a joke. As much of a smart &$$ (edited as not to offend), steve sweet is, he does have a point from time to time. Some people are overly critical and don't respond well to correction. As for being an adult, as far as I am concerned "never argue with a fool, people might not know the difference". I don't care if he attacks somebody, hell we all get it eh peter;-). But to continue the argument is futile. Let what needs to be said, said, and leave it. No more argument. The net is the last vestige of free speech (even if it is sometimes unsubstantiated). I think Steve has a right to be heard, yes marpet most certainly did use card to cover PCBs, as did actionsoft too. I don't completely agree with all of everybody's comments and I never expect to. But steve is intelligent and he is Atari aware, so zip it and let him help the odd chap with a response. Don't flame him and expect that to be the end of it, as obviously that won't happen. Steve is not the only person guilty of this is he? So I reckon let it go and get on with our lives. That is all I will say.

Can't be done without serious hacking as EGA isn't anywhere near RGB
standards. I think it is digital from memory? RGB is analogue:-(Could be
wrong tho.

Just thought I would add my 2p's worth,

My old HW DVD decoder used an external pass through cable a bit like the voodoo 1/2 cards had.

This means that there is only data going to the card. The graphics card is bypassed. (Your monitor plugs into the decoder card).
When you are not using the decoder card the graphics card works as normal.

There would be no need to send any uncompressed data to the graphics card at all.

Hence I do strongly beleive that the Falcon should be able to do it. My 486 DX 33 can, and it does a perfect job. Dolby digital and everything.

Oh and I can't remeber the website of the top of my head, I think it was http://tucows.cableinet.net they have a section about DVD stuff.
In there they have a FREE programm for playing DVD movies on hardware controllers so if the keys are so expensive how can they produce such a programm as freeware.

i'm not saying your wrong, I would just like to know how they have done it.

The maximum transfer speed is the same as for any other SCSI drive
connected to the Falcon, appr. 1.8 MB/s. You cannot get higher speeds
with Falcon SCSI, regardless of the drive that is connected.

Switching background pics off and using the "greyscale" display option also
helps muchly, most especially in the 16 colour mode that I habitually use.

BTW, re the download speeds/mouse movement/corruption problem you
mentioned. I often see speeds of around 5000 cps reported, and I can use
other progs in the background etc etc with no problems at all. Rodolphe's
CT2B accelerator is all that it's cracked up to be IME.

Message-ID: <_G1u6.70$SK4.1240@newsfeed.slurp.net>
Source record: 48653

1. When I partition the 2.2 gig HD into two 1.1gig partitions it works fine under TOS 4.04. However when I load Magic it gives an error when I try to access it. Only when I partition the drive into five 430Mb chunks does Magic read them. What's going on? I use HDDRIVER 7.80. I tried AHDI with the same results.

2. The CD-ROM that I have will browse the cd's but will not run/read anything from it. In other words, I can see the contents but can't read. I tried different cables etc with the same results.

Please, if anyone has some ideas I'd appreciate some help. Thanks.

I have a Mac SE with two 800K floppy drives, built-in monochrome monitor
and a 45 MB external SCSI hard drive that I would like to trade for an
SC 1224 color Atari monitor. I do not have the manuals or system disks
(although System 6.0.7 is on the HD, also MS Word 4.0) but the system is
in good working condition and in good cosmetic shape (there may be some
yellowing of the plastic, but no major scatches or markings).

Because of the weight of the computer, U.S. only trades, please.

If you are interested, please send me an e-mail at main@appstate.edu

Hi Joshua,

The CD-ROM sounds like termination, check it and check it again as this is exactly what happened to me, I could see all directories and files but when I copied them they were corrupt.

It may also be the media (I assume you have tried a different CD) or its format (i.e. what CD software do you use)?

Mark.

The Milan uses EDO simms which are 70/60ns. That would seem to be
like the memory is 16Mhz, but I'd hate to see the PCI running at this
speed too. Are there any doc's on the Milan? Anyone tried to
overclock it at all, I suppose it's quite fast as it is compared to
most Falcons/TTs! :)

Yes, I've seen these, and if the decoder-card does both decryption and
decoding, this could work on a Falcon with Eclipse if the Falcon's
IDE-controller is fast enough.

> This means that there is only data going to the card. The graphics card is
> bypassed. (Your monitor plugs into the decoder card).

...except that image quality suffers due to the extra cable and circuitry.
But if the decoder card supports S-video or composite there's no need to
connect the monitor to it.

> http://tucows.cableinet.net they have a section about DVD stuff.

The only *legal* free DVD-players I've seen are made by the
hardware-manufacturers themselves, purely to boost sales to Linux-geeks.
The extra cost is covered by increasing the price on the hardware.

The keys are not free, neither is the source AFAIK (I've never seen a open
source DVD-player, correct me if I'm wrong), so the only chance to get a
legal DVD-player for our platform would be to persuade one of the
hardware-manufacturers to support it. Good luck to anyone who would
attempt this ;-)

Hi Joshua

>1. When I partition the 2.2 gig HD into two 1.1gig partitions it works
>fine under TOS 4.04. However when I load Magic it gives an error when I
>try to access it. Only when I partition the drive into five 430Mb chunks
>does Magic read them.

I believe the Partition limit under MAGIC is 1GIG, so try with exactly 1
GIG partitions, use the odd .2 gig as a boot partition whilst you
experiment. This will give you C:,D:,E:.

I'm sure that Uwe will be along shortly to put us straight on this issue.

>What's going on? I use HDDRIVER 7.80.

Good choice.

>I tried AHDI with the same results.

AHDI is only of use for scrapping ice off your windscreen in the morning.
<Flame-bait> :-)

>2. The CD-ROM that I have will browse the cd's but will not run/read
>anything from it. In other words, I can see the contents but can't read.

What software are you using to drive the CD-ROM.
In general, software wont run off of a CD as it will need to write
something to its source such as default inf files, i always copy stuff to
disk if i want to play with it.

>I tried different cables etc with the same results.

It might be as a result of mis-configuration of your CD driver.
Perhaps you could be more specific of what you have and what you are
doing with it?.

Hey everyone! I'm trying to use the gcc compiler on my TT runnning MiNT 1.15.5 without memory protection. I have used rpms to install gcc-2.95.2 with all the bells and whistles. Now when I try to compile a program on the Atari in a GEM shell window, I get a BUS ERROR when the compiler tries to run ld (which I believe is the linker). It gives a "fatal signal 10."

I onmly installed the gcc rpm and some supporting languages on top of my KGMD install (with updated mintbin and binutils, which are required for the gcc rpms to install) Should I have installed another rpm containing ld or something? Any ideas?

I had the same problems when trying to install gcc 2.95.2 on KGMD just two days ago, and got it solved by 2 things:

- You have to install new mintlib package also for 2.95.2 (besides mintbin & binutils). The problem here is likely that the linker ld does not have new libraries, for startup exe code for example, like the file /usr/lib/crt0.o. These libraries are in mintlib package along with new includes etc. That solved my problem with ld, anyway.

- *Probably* there is also a memory problem when gcc executes. I have an Atari STE 4MB here, so this was the first problem I encountered when upgrading... gcc 2.95.2 is alot more memory hungry than the old gcc included in KGMD- I got "out of memory" errors and bus errors. It still does not work good at all (probably it really only runs on TTs and Falcons?),but I solved the biggest probs by changing the stack size of the gcc,cc1,cpp, etc... programs with the program "stack" included in mintbin. Be careful with that, though, read the docs before you try anything with that program (it is all documented, somewhere in the readmes..") and write down the original stack sizes if you change sth. That might be an option if everything else fails...

BTW, did you install a new kernel also on top of the KGMD installation? I am wondering how to do, and if there are any benefits memory-wise?

Regards,
Ove

>have a fixed IP adres...

You want to have a BBS Pro as well as a BBS Express ST online? For
BBS Pro there is an emulator and some way of hooking it up to telnet
already, so that shouldn't be too hard. For Express, I think I'm the only
one whose done it. If youre goal is to just keep an ST running, you'll
still need some software to server as a telnet daemon, and have it talk to
the ST serial port from your PC serial port. Does anythign like that
already exist? I bet theres somethignlike that for windows or dos..

One static IP, and then have a box on it. That box can feed people
over to one of the two bbses?

Lots of work my man :)

>I like to have the source for the 8to16 convertor from BBS Express! that
>would make it much easier to make an convertor or I need to have detailed

The source to that tool isn't public. The structs for the message
bases were published years ago.. I'm pretty sure I have them around
somewhere, if you get desparate. Most of my floppies have gone bad over
the years though.. so its a pot luck draw :P

3847. Atari ST - Emulation VS. Hacking One Up

Newsgroup: comp.sys.atari.st
Date: 2001-03-21 23:20:07 UTC
From: the_dark_intruder@NOSPAMyahoo.com
Message-ID: <Xns906BB064B7AEFthedarkintruderNOSPA@24.14.77.6>
Source record: 48680

Greetings, fellow Atarians,

Having owned two 1040STFMs over many years, and having quite a bundle of software for it, these days it mostly occupies space in a closet. So, I dug it out last year, and I started digging up tech documents, thinking that I would tinker with it until I broke it completely. I put in a HD/DD switch, changed the mouse to a BUS Mouse, now I'm trying to figure out how to rig a keyboard to it without buying hardware.

I found Vezz's excellent Hardware Hacks site, and was immediately intrigued by what I could (and could not do) with this old hardware. My list of projects began:

1) Upgrade the color to 32K colors
2) Upgrade the RAM to at 4 megs (a 16 meg project was available as well)
3) Build an ethernet controller and run it as a "net station"
4) Build the IDE controller interface, and add a big fat IDE harddrive and CDROM
5) Increase the speed
6) Upgrade the TOS to 2.06

After looking at all that I would have to do to finish this total hack, I stopped and thought about it. What was I trying to do? I was trying to get this machine up to some kind of usable condition, so that I could use it along side of my IBM PC (an Athlon 500 with all the bells and whistles).

Is it worth it? Or should I just restrain myself, and play with emulators?

Your opinion is valuable, so give it.

David

Hello Mark!

b> ...how do i connect my ste to a EGA monitor...

MB> Can't be done without serious hacking as EGA isn't
> anywhere near RGB standards. I think it is digital
> from memory? RGB is analogue:-(Could be wrong tho.

You're right, it uses TTL voltage levels, and two wires
for each of R, G & B - yielding a palette of 64 colours
(although only 16 could be displayed at once). EGA is
officially very odd.

Regards,
- Andy.

I didn't know where else to post this, I figured someone on one of the 3 Atari newsgroups I read would have an answer to my problem!
I just got my hands on a Lynx 2 system (it came in a whole lot of Atari things I bought today). The system looks to be in very nice shape, was complete with its box/manual (even had the registration card still!)
The person who I got everything from told me the Lynx didn't work, he had no clue what was wrong with it. I tried a fresh pair of batteries, and it didn't work for me either. I was wondering if anyone would have an idea what could be wrong, or is there anywhere I can send it to be repaired (or would that just be to costly, and should I just get a whole new one?) A dumb question: do you have to have a game in the unit for it to turn on? I don't have any Lynx games here, and I've never used one so I figured id ask =)

Thanks in advance!

That is bill gates secret weapon. Somebody buys a PC, then it goes pear
shaped. Then I get it to repair and I say "give us you win9x disk and
liscence". Then thaey are forced to buy it anyway......

emulator's PAH, the real thing is much more satisfying;-). I have 3 STFMs, 1
is seriously hacked. Overscan, TOS 2.06, HD floppy (auto switching), high
speed serial 2.5 meg (soon 4). I still have more to do, but god its fun if
you can afford the bits.....

Sounds like the power managment circuit is broken.
I described the "how to repair" the power in circuit in DOITLYNX.
But thati¿½s all in german. Nobody translate it, i doasnï¿½t can do that.

You cannot simply overinstall the new gcc on a KGMD setup. You strictly must remove all of the old things (old binutils, old mintbin tools, old gcc, and, very important, all old header files and libs).

You must strictly install new mintlib-devel rpms too. New gcc only work with new mintlib.

If you want to use an old library that you created with the old binutils you must first *convert* the library into the new library format (the library format has changed to be compatible with the current binutils, see arconv in the mintbin rpm). Due to the libformat changes the new ld crashes if he got old style libs as input.

But there are almost all libraries as rpm packages available too. If you miss a lib tell it me and I look that I can do.

Without a game cartridge the Lynx won't power up, and I paid $1 for mine
with a game so getting it repaired isn't a viable option I don't think.

>Resulting in a corrupted, half download. This is on a Falcon BTW.

Yes, a cheap, unbranded 56k modem and CAB 2.7 on a Nemesised Falcon in mono! Good phone line (from NTL) helps. The 10000+cps on Cix I only started getting when I changed to GSZRZ from XYZ.TTP. With archived binaries it is down to some 6500 so it seems my modem is doing a go0d job at compression/decompression!

I suggest you move the mouse as little as possible -- only for selecting links -- and switch off the screensaver when online.

Regards, /Peter/

Good site.

>1) Upgrade the color to 32K colors

Never attemped this although I did look at it.

>2) Upgrade the RAM to at 4 megs (a 16 meg project was available as well)

4meg is easy enough. 16meg schematics are incomplete. It is possible
though. I'll have to get on to Branko about this (and some other
stuff too)

>3) Build an ethernet controller and run it as a "net station"

Never seen this at Vezz's but I know there is an adpator for the ACSI
port to ISA for an NE2000 type card.

>4) Build the IDE controller interface, and add a big fat IDE harddrive and
>CDROM

Yep, it's good. what about building the SCSI controller too then?

>5) Increase the speed

Difficult. Putting cache on and 16Mhz is still slow. Get NVDI
(software) to speed things up!

>6) Upgrade the TOS to 2.06

Illegal. Install mint/Magic instead.

>Is it worth it? Or should I just restrain myself, and play with emulators?

It's good fun. It would make it alot better than an emulator.

><Flame-bait> :-)

It sure is flame bait.

Get this, I always used HDDriver and I have v7.8. An old IDE Conner 80Mb
failed badly on my STe so I tried repartitioning it using HDDriver but
the corrupted contents were left on there. I tried formatting it
which only made it worse! I know, you shouldnt format IDE's but I was
desperate and it was ancient anyway.

It would now hang on a partition. So I dug out AHDI and did a format
and it did it perfectly and marked out all the hundreds of bad
sectors :)

So, why did AHDI do it, when HDDriver couldn't?

I run my board now on a normal telephone line 24hr/7days, when I get ADSL
permanent internet soon, I will put it on the internet by telnet. There is a
proxy server in Win APE... Secondly I have a mux so I can network 4 8-bit
BBS computers together, 3 on tel-net and 1 telephone-line...

3869. Question about "magic_pc.os" and Gemulator98

Newsgroup: comp.sys.atari.st
Date: 2001-03-22 19:59:55 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <99dljrcci1@freenet9.carleton.ca>
Source record: 48606

I'm trying to install Gemulator 98 with a TOS image file renamed
"magic_pc.os". All I get is garbage on the screen.

This setup worked fine under the DOS version of Gemulator (3.x).

Any ideas?

Randy Kwak

P.S. I *DO* have a Gemulator card with official TOS ROMs in it. I also
have a few extra Ataris I could plunder for extra ROMs if required.
Newer PC motherboards have fewer or no ISA slots, however, and I want
to be prepared.

Thanks

3870. Mega STE clock battery

From: taj16@dreamscape.com
Message-ID: <tbknkm4jsh82d4@corp.supernews.com>
Source record: 48607

A friend gave me this Mega STE nearly six months ago. I have been using it with a Toadfile 44 with an ICD ADSCSI+ host adapter, the one with the clock. However, I'm now using The Link with an external Syquest 200Mb removable HD. Changing to this revealed that the battery for the Mega STE's clock is gone, removed altogether. I've looked inside, but see nothing to indicate where the battery goes or what battery is needed.

Does anybody know? Even if I couldn't get the proper battery, information on the voltage and polarity at the connector might allow me to cobble up something that would work.

Thanks in advance for any help. Doing without a clock is getting to be very annoying.

3871. Sting and CAB

Newsgroup: comp.sys.atari.st
Date: 2001-03-22 20:20:55 UTC
From: taj16@dreamscape.com
Message-ID: <tbknl7qnfpnve1@corp.supernews.com>
Source record: 48608

I've been having an increasing amount of trouble lately (at least it *seems* to be increasing) with the CAB 2.7 demo. When loading pages it often seems to get stuck with a "waiting for data" message. If I leave it there it just seems to wait until it times out. If I hit the 'stop' button and reload the page, sometimes it will go through the spot where it got stuck before and sometimes not. The more complicated the page, the more often it gets stuck. Some pages absolutely refuse to even start to load, no matter how many times I try.

I'm currently using CAB.OVL 1.44 and Sting 1.26 on a Mega STE using the Modem1 port at 19200bps. When I first started using CAB I was using a Mega ST4 with TOS 2.06 at 14400bps, Sting 1.22, and CAB.OVL 1.3-something.(I forget what now.) The way I remember it, I had less trouble with the old setup.

A friend suggested that the 'delay' setting in Sting could be the problem. The first version of Sting had been configured for me, but I did the latest version myself by following the included instructions for 'novices'. Nowhere in those instructions did they mention the delay setting, so I left it as it was when I got it, at 50. Later, I read up on this delay and found the provided default is at the slowest for 'slow machines like the ST'. The recommendation for ST's is 25-50. For TT's it's 10.

Could this be the cause of my problem? If so, where should I set it? 20? The Mega STE is faster than the ST but slower than the TT, I think, so it seems like 15 or 20 would be correct. If it isn't the delay setting, what else might it be? Increased Internet traffic? Intermittant line noise?

Ok, I must have missed the mintlib rpm. But I now have it installed
along with mintbin-devel. So I have fulfilled all dependecies for the
gcc rpm. Including the mintlib ones, which were not listed,
apparently. Now the c compiler works like a dream. But g77, the
FORTRAN compiler, which is what I really need, still has the same
error. I did install the new g77 rpm along with gcc. So the versions
match. But I still get a fatal signal 10 when compiling. This error
is gone when I use the c compiler. Any thoughts?

From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3abacc76$0$18887$272ea4a1@news.execpc.com>
Source record: 48612

Hello,

I have a Mega ST4 (TOS 1.04) - Megafile 30 - SH204

The Megafile 30 is connected to the SH204.
Dip switches are adjusted accordingly in the SH204.

Right now I am using AHDI v.5
This is working quite well.

When I got my Falcon it had v6.xx
I think I picked up the very last AHDI (6.06c - I think)
But it was only AHDI.PRG and not AHDI.SYS
and no HINSTALL program.
What does one do? Change the .PRG extension to .SYS
Then copy it to the boot partition?

Would this very last version (6.06c) work on an ST4 or is
this just for Falcon only?

My reasoning is that I would like to put the most current driver
that I can on it.
Hopefully avoiding the 100 extra folders business.
But I don't know if this is possible.

thank you

ken

It depends upon which programs they are, unfortunately.
If they are both relying on the same hardware, eg MIDI ports, then it is unlikely that you'll find an operating system that'll run both at the same time.
If, on the other hand, they are 2 GEM applications that run in self-contained windows, multitos may work. It'll run too slowly on an STe to be of great use however. With geneva or magic you may be able to switch between applications.
Personally, I'd find an equivalent to one of your programs that'll run as a desk accessory, there are quite a few progs that'll do this.
Then you'd have switching between the two programs with none of the other hassles, one being run from desktop, other called from accs menu.
And you'll stay in TOS/GEM which gives you guaranteed compatibility with your other software. (Which the alternatives cannot provide).

Horses of courses Lyndon. I found HDdriver great on the most part, but have found a couple of drives that it disagrees with. In the PC world occasionally I find a drive with a stuffed partition that FDISK won't like, so I use Linux. Usually works. I do the same on all my Atari's. Occasionally I find that you need to repartition with different software (AHDI or ICD etc), to stop the old partion being read by the driver. It just happens for some reason. I only came across 1 drive Hddriver doesn't like, and my Falcons have seen plenty;-).

Ahh, been doing simillar, looking at a half gutted mega as we speak. on the right hand side of the mainboard, under the row of jumpers, you will see a 3 pin socket, labeled j401. That is it. You plug in a 3.6 volt battery, obtainable from most PC shops, and plug it in. Ground is to the front of the board and positive is to the top;-)

My 4Gig (I don't know the exact size) SCSI drive is recognized if I
partition it into two equal sized partitions, so the max partion size is
2Gigs, as was thrashed out a few months ago?

Nothing to do with the version of MagiC used? (Mine is 6.01).

If you use the IConnect overlay you won't, and if you use one of the STinG
overlays and have the Dialer in memory (or have previously run it and exited
from it) you won't either.

There's an overlay available which is strictly for use for offline reading,
but there's no need for this if the above points are borne in mind.

Cross-posted to:
alt.atari-jaguar.discussion,comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.marketplace
Body handling: HTML body converted to readable text

e-mail: atari@benjamin.net

Lately I've added more Atari inventory so checkout my Catalogs. Even my 8 Bit Atari Software grew by 25%! And I'm offering a 20% Discount to my regular customers! E-Mail for Details on Redeeming this offer! I'd like to say Thank You for letting Bravo Sierra Computers Support you & your Atari Needs. And if you have'nt bought from Bravo, Give Ben a Chance! I can be quite Beneficial. And remember, if you can't come see me today? Come see me tomorrow! E-Mail or call Ben anytime at (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Best of luck, the BBS scene in the UK disappeared a long way back. I've
still got my Point setup on my hard drive, Semper, Jetmail and LED, but I
only run LED now and again to refer to some messages that are archived
there.

If you're looking at it as an intellectual exercise then go to it, but if
you want to use the result as a serious DTP or graphics machine then I'd
think more in the direction of using that PC with an emulator. You'd get a
decent screen resolution and colour depth, that 32K colour mod. won't really
be of much use AIUI.

Just my tuppence worth! :-)

>have any Lynx games here, and I've never used one so I figured id ask =)

My Lynx 1 powers up with a "Please insert cartridge" on the screen if one
isn't found.

In the UK, Telegames in the past have turned up at the computer fairs in
Stafford with Lynx 2's at very low prices, so you might be better looking
out for something similar.

It's a decent machine IMHO.

Have you considered putting the DOIT archives up as HTML on your web site
Robert? I know that that goes against your policy of checking who has copies
of your work, but it would let people use an online translation engine like
Systran or Babelfish to translate the bits they wanted?

I didn't think of that :-)

I just merged each section in and deleted the headers, only took a few
moments, but if I'd had just saved the files with those extenders...

BTW, anyone know a good TTP, like Munpack, but one which knows LFN's?
Munpack gives a "file not found" error if the source isn't the standard DOS
format.

As I said, my Lynx 1 has sufficient "nous" built-in to ask for a cart. if
there isn't one plugged in. I doubt if Atari would have removed this
function from the ROM for the Lynx 2.

Do I care if you believe me that I've sent the letter to Infogrames or not? NO. I have. Now, as far as following through with actually sending you or anyone else the letter, I simply have been too busy to do so. My wife is online most of the time with her business, so I don't get many chances to get online myself, except at night sometimes for a short time (30 minutes or so).

But, to update everyone on the progress thus far, no reply has been received yet, in any fashion, from Infogrames. Do I expect one? Not really, but I refuse to give up hope until I hear something more definate from Infogrames one way or another.

Oh, I see... instead of seeing the value it has as a morale booster, you decide to use it as a joke point. Yeah... some supporter you are. Why don't you go stick your head in the Sands of Atari's Death until Atari returns or you suffocate from lack of oxygen... whichever comes first.

Now THAT'S quite a laugh, really.

Mine's loaded as a prog but it is removed from memory when I click on
the exit button.

Hi everyone,

Atari Workshop just sent me my lovely new software which is Magic ,
NVDI 5, Jinne 2.5 and Scripter.

Main problem is which order to install. I'm thinking,

Magic
NVDI
Jinnee
Scripter

Or should NVDI go first?

I'm gonna have to get started with Scripter but don't seem to have a
manual sent to me. I suppose it's online then? Came in a strange CD
case with a plastic insert for floppys. Never seen this type of
packaging before!

I'm laughing because you're advertising not only one prduct, but two
products that don't exist. If you want to help us all and bring Atari
back, get yourself GCC and program us a Java web browser. I can't see
how that advert can help anything. At least draw up some rough
schematics, or find out about good chip sets to use.

BOOOOO!!!

Yep I'm Back, Like it or Not! :)

For now my E-mail address is phantomm@bellsouth.net.
UpDate your Address File if you need too.

This Address will be valid for at least 2 weeks in case you need to contact me. This will give me some time to decide if I will keep this address for awhile.

phantomm@bellsouth.net

3908. VIDI ST and VIDI ST 12

Newsgroup: comp.sys.atari.st
Date: 2001-03-23 18:38:57 UTC
From: phantomm@bellsouth.net
Message-ID: <5LMu6.101$X_.8524@news2.atl>
Source record: 48632

I have VIDI ST and the VIDI RGB Splitter for the Atari ST/STE.
Does anyone know what the last versions of VIDI CHROME and VIDI ST
are?

I also have G-Base that makes use of VIDI ST. Does anyone know if there
are any other software programs made for VIDI ST?

The VIDI RGB SPLITTER has an interesting 25 PIN I/O connector that one
can tinker with. Did anyone make anything useful or interesting for this
connection?

Also, I'm looking to purchase or trade for, VIDI 12 hardware and software
that is the Atari Falcon Version. I think this was the only Falcon version?
Someone correct me if I'm wrong on this, as I am looking for the best
VIDI hardware system for the Falcon that was made.

If you have 'em for sale or trade then contact me by e-mail at...
phantomm@bellsouth.net

And if you have 'em but don't want to part with them, could you e-mail
me some details about the hardware and software?
I'd like to know the last versions of any software that came with it and
what the hardware/software can achieve on a Atari Falcon.

Atari Video Digitisers and Animation are a hobby of mine, so if anyone
else has the same interest maybe we can exchange e-mail, info and etc. :)

And as always, still looking for working or non-working Expose's and
ScreenEyes. And any Atari ST-Falcon Video Genlocks and software.

Thanks,
phantomm@bellsouth.net

3909. CenTurbo II B Latest English Flash and Software

From: phantomm@bellsouth.net
Message-ID: <PYMu6.106$X_.8524@news2.atl>
Source record: 48633

Hi,

Does anyone have the English Version of Flash 1.41 for the CenTurbo II B version?

I downloaded the French version along with all other CT2B related software from CENTEK's Web Site, but it's all in French and I see no English Links.

If there is a English URL for English Versions of the lastest Flash and related software, then do e-mail the URL to me or post it please.

Also on my original CT2B Disk I received French Versions of the CPX's. Can someone e-mail me the English versions?

Also on my original disk I received an ACC called CECILAUD.ACC with a RSC file with the same name. I've installed it and looked at it but never tried to use it. It looks like a CD Player, Did anyone else get this program and is it any good? Any details is much appreciated as there were no English Docs with it.

Thanks,
phantomm@bellsouth.net

> I have. Now, as far as following through with actually sending you or
> anyone else the letter, I simply have been too busy to do so.

Wow! When do you even find the time to compose these long treatises about the holiness of the Atari name and how everyone else is just blind or insensitive to the fact that a PC games company would obviously care about old computer hardware, supported by a relatively small group of people, who most likely have nothing to do with their product?

> My wife is
> online most of the time with her business, so I don't get many chances to
> get online myself, except at night sometimes for a short time (30 minutes or
> so).

30 minutes? I'd guess it'd take about 30 seconds to convert the word processing document to an ASCII text file and post it. As far as time, I'm a full-time student working 2 (sometimes 3) jobs, and I seem to have more time than you apparently do. How do you expect to make any kind of progress in this venture you're proposing with so little time?

> But, to update everyone on the progress thus far, no reply has been received
> yet, in any fashion, from Infogrames. Do I expect one? Not really, but I
> refuse to give up hope until I hear something more definate from Infogrames
> one way or another.

I guess you'll never give up then, because my guess is, they just had a good laugh and threw your letter and audio file in the trash.

As I keep saying, don't waste your (and our) time on this. If you really want to see the Atari platform grow, support the companies that actually exist. Maybe someday we'll get really (really, really, ...) lucky, and some multi-billionaire who has a thing for obscure technologies will donate the money to help put our platform in the limelight. Then and only then would whatever company that holds the rights to "Atari" at the time take any notice of us. But even then we'd still need good software to make people take interest. Without that, the hardware side's pretty useless. So unless something amazingly unlikely happens, I don't think any venture like yours will be taken seriously. So focus your attention in more effective areas, like promoting new hardware and software that actually has a chance of

existing from companies and people that really do exist (Tempest, CT60, Pegasus, Milan III, etc.). This way, we can at least have advancement instead of false hopes in companies that won't give us the time of day. When/if we are ever caught up to the rest of the world, then maybe we'll have a minute chance of grabbing part of the computer market.

>gone, removed altogether. I've looked inside, but see nothing to
>indicate where the battery goes or what battery is needed.

So if you cant see where it goes how do you know its gone. Its supposed
to live at the back of the HD bay, and may be snuggled up under the
floppy cable, or even hidden under the ACSI interface board.

Atari workshop can supply you with a new battery, phone 01344 890 008.

Xns906BB064B7AEFthedarkintruderNOSPA@24.14.77.6...

> 1) Upgrade the color to 32K colors

Apart from the hacking value I see no use in this. Software support will be
very low.

> 2) Upgrade the RAM to at 4 megs (a 16 meg project was available as well)

Well this is realy worth it.

> 3) Build an ethernet controller and run it as a "net station"

Yes, would be nice.

> 4) Build the IDE controller interface, and add a big fat IDE harddrive and
> CDROM

Big fat is not necesarry 2Gb is an incridible amount for ST's.

> 5) Increase the speed

Yes, good idea.

> 6) Upgrade the TOS to 2.06

Have a look at KAOS TOS. I am still using it. It is nice compact and fast.
You need a decent desktop replacement though.

> Is it worth it? Or should I just restrain myself, and play with
emulators?

I think a decent emulator is needed. One to toy with. Spare parts are
becomming rare. I heve to get a fully functional alternative before I run
out of spareparts.

Bye, Hans

From: Steve Sweet <steve_sweet@madasafish.com>
Message-ID: <985379286-491907AEicMi@madasafish.com>
Source record: 48641

Hi Lyndon.

>Atari Workshop just sent me my lovely new software which is Magic ,
>NVDI 5, Jinne 2.5 and Scripter.

>Main problem is which order to install. I'm thinking,

>Magic
>NVDI
>Jinnee
>Scripter

I'd upgrade Magic, then reboot, just to make sure all is OK.
Now install NVDI and reboot, again just in case.

Now you can install Jinnee, adding, edited to suit your system...

#_SHL C:\Jinnee\JINNEE.APP
#_ENV AVSERVER=JINNEE
#_ENV JINNEE=C:\JINNEE\JINNEE.APP
#_ENV GEMSCRIPT=C:\GEMSYS\MAGIC\START\SCRIPTER.PRG
#_ENV HOME=C:\System\
#_ENV PATH=.\;C:\;D:\;E:\;F:\;G:\;H:\;I:\;J:\;K:\;L:\;M:\;N:\
;O:\;P:\;Q:\R:\ ;S:\;T:\;U:\;V:\;W:\;X:\;Y:\Z:\

to MAGX.INF. For now you can just click JINNEE.APP to check it is
functioning, if it dont winge reboot again and you'l come up with
Jinnee as your desktop.

Now install scripter, putting it in C:\GEMSYS\MAGIC\START\
also put here the folders and contents of

\BIN
\PLUGIN
\SCRIPTS
\LIBS

Now, when i first installed Jinnee on my system the context popups
didnt work properly, so make sure you have the folder structure

C:\Jinnee\Jplugins\context\

and put all Jinnee's .SIC in here, probably found in a folder caled
zusast.

A hold right click will now give you a popup with the entry PLUGINS
at the bottom, the content of this will depend on what was selected
when you hold R-click, all will be revealed later.

When youve done this and al seems to work, get back to me, some of the included scripts are poxed, some are duplicated. I'l send you some corrected/modified scripts.

This isn't Windows you know ;-) It really doesn't matter which order you
install it in, but for convenience I'd suggest to install and boot MagiC
first, then install the rest of the stuff.

What's Windows?

I've heard some people talk about it, but I've never seen a machine running it.

I guess it's just too obscure for any of the shops to bother stocking it...

Ahh well, at least it isn't made by Microsoft - that'd be the death knell for the little support Windows has managed to build up over the years.

> Many thanx

It *should* work if you start by formatting a disk on your PC as a 720Kb, double-sided disk (use specifically 720Kb 2D disks rather than 1.44 Mb HD disks, if you can find them - don't know if HD disks would even work). Definitely do not format it as a 1.44Mb disk. It should then be usable on both systems. There's also a program (I forget what it's called - anybody remember?) that allows the ST to format PC-compatible disks. It's a matter of some FAT info being slightly different.

You can even get consumer PCs in that sort of configuration, and
even build your own "bookpc". My wife's WinBox is just such a
machine.

--

Ease of use should be associated with things like "human engineering"
and "use the right tool for the right job". And of course,
"reliability", since stopping to fix a problem or starting over due
to lost work are the very antithesis of "ease of use".

The LGPL does infact tend to be used instead of the GPL in instances
where merely reusing a component, while not actually altering that
component, would be unecessarily burdensome to people seeking to
build their own works.

This dramatically alters the nature and usefulness of Free Software
in practice, contrary to the 'all viral all the time' fantasy the
anti-GPL cabal here would prefer one to believe.

holes
> do I cover on the disks to fool it?
> Anyone know?

Assuming the discs/drives haven't changed in the last few years (I
haven't used floppy discs for about 5 years or so)

A 1.4 MB floppy disc is in the same plastic case as the 720k discs, with
the same sliding tab used to write-protect the discs.

However, an extra hole has been added to one corner, and it is this hole
that the drive uses to detect whether it is a 1.4 MB DSHD disc, or a
720k DSDD disc. (I don't recall there being an easy way to detect if the
double-density disc was a single-sided 360k disc peculiar to the ST, or
a double-sided 720k disc common to the ST [and the Meagre?] and PC,
short of trying to read/write side two)

Covering this hole will generally fool the drive into thinking it is a
720k disc.

The DOS FAT is in roughly the same layout as a 720k disc, only it is larger, as there is twice as much data stored on the disc. There are a few differences with the boot sector of the disc ("media descriptor" used by DOS to determine what kind of disc this is, sectors-per-track [18 instead of 9] are the only two differences that immediately come to mind)

I _think_ the actual disc platter within the plastic case is thinner, and spins a wee bit faster. (What I've read, and been told over the last 15 years on these two points seems to conflict with everything else)

This may upset data reliability, as the drives use a stronger signal to write to the 720k discs, so some data may "leak" through to the other side of the disc, corrupting the data that is already there.

During the early/mid 1990s, I used to write and support a replacement disc formatter/copier for MultiTOS which would work with all sensible ST and PC DOS formats. While it was happier under MultiTOS, it should have run under a smaller SingleTOS system without major problems - I just didn't know anyone with such a system at that time.

If anyone is interested in it, I'll ferret through my backups and see if I still have it (Its development stopped in 1996-ish). Hopefully there should be some details about DOS disc formats with its notes

Thanks. Just what I needed to know. J401 looked suspiciously like a
polarized connector, but there isn't anything there to show the voltage or
polarity. The original owner told me the battery went bad and he removed
it, but couldn't remember the details for sure. It's been a while.

3.6 volts, eh? Sounds like one of those rechargable NiCad packs they use in
portable phones and such. Is that what it uses? Does the Mega recharge the
battery when powered up?

If you, in fact, need FORTRAN as a tool to solve some problem, does it
need to be gcc/mint environment? I know of at least three other FORTRAN77
compilers for Atari (BC, Prospero, Absoft), some better than others,
but which may be simpler to install and less memory-hungry than gnu stuff.
E.g. I used to run Prospero FORTRAN happily from a RAM disk on a 1MB ST.

I can't remeber totally but when you do a format it asks if you want
to mark bad sectors, so I clcik Yes and it does another format and it
comes out with that dialog box again, and I'm going round in circles.

After a while of that while formatting and listing bad sectors it hung
on one particular one.

I didn't bother mentioning it to Uwe as I don't think this is a commen
drive. Anyway I'm the only one stupid enough to be using an old Conner
80Mb :)

Ok that's good. I just though NVDI overwrites some of Magic screen
drivers or something like that in the Gemsys folder. I'll try
all my software tomorrow.

I'll read over that in the morning. Thanks for all the stuff I need
to edit, although I'm getting a bit more familiar with Magic these
days. I think I'm gonna like using Scripter.....

Why don't you use a decent ftp-program for such operations? Newsie never
has worked for me.

>I have Magic first, then NVDI just you have it and it works fine for me. BTW,
>tell me how how like Jinnee 2.5. I have version 1 and want to upgrade soon.

I'll admit it as most people had a feeling my software was
pirated/cracked. I've been using Jinnee since I got my Falcon back in
January which had cracked versions of Magic 6.10, NVDI 5 and Jinnee
2.5. After spending that much money for the Falcon, cash wasn't at
hand so I've been using it since then.

But I soon realised that some things wern't working quite right, like
printing via NVDI so I bought the proper software from Atari Workshop
last week.

So Jinnee is great. I haven't used Thing so I can't really compare.
But switching from TOS 2.06 to Jinnee was great! I just like the way
it has so many options and I like the way you can put images in the
background of windows.

I have the following ST materials I'd like to give to someone who can use them. I am not interested in parting these out or in shipping them off. If you can come and take this STuff off of my hands, I'd be grateful. I have:

Atari 1040STfm (TOS 1.00) - 1ea.
Atari 520STm (TOS 1.00/no keyboard) - 1ea.
Atari SC1224 monitors - 2ea.
Atari 520ST power brick - 1ea.
Atari mice (grey) - 2ea.
Atari SF314 DSDD FDD - 1ea.
Misc. software/books

I'm located in Medford, OR. If anyone is interested, please contact me at kong@Wigloo.zzn.com or funkenstein@wave.net and we'll see what we can come up with. Thanks!

I have a 4 meg STFM, Monitor, Hard Drive, High Density floppy, PC emulator (ancient), more music software than I can be bothered to list but includes Cubase, Pro24, Band in Box, couple of score writing progs, Dr T, plus Protext, Prodata, Twist, Calamus, that bloody awful picture editing thing that takes three weeks to load and a month to process stuff, (all legal with manuals), anyway, you get the gist...

As I have regretfully deserted the platform and moved to a PC, if anyone out there wants it for a reasonably unsensible price, and can come and getit, because that would certainly be easierr than hiring a train to take it to you, it might as well go to a good home instead of being theatened by mice in my loft.

I'm on the Wirral, UK, and a hundred quid and it's yours. All of it.

I don't know yet, as the CPU was killed during installation... However, I checked out the timing on the ADSpeed's chips, and it looks like 12/24MHz should work just fine. It depends on how fast CPU I can find I guess. If anybody here have a spare 68000, please contact me.

> Btw. beside accelerating the CPU, ADSpeed is supposed to also have

Yes, all their software is great. I have every piece of software they
sell and it all functions excellently on my Hades. I hear that most of
their programs are going to be upgraded soon. Programs like CDISO and
CD Backup will be able to use more than one CD disc. Sounds good to me.

> Have you considered putting the DOIT archives up as HTML on your web site

Yes, as i started that work.

I doasnï¿½t have the time, money and the webspace to do that.
Usable webspace with usable speed isnï¿½t free. It is sensless to use an
provider with x free webspace and no ftp connection any three days or
more times any month.

As i startet with internt the first provider gave 10MB to me with an
bullshit access of an 64k line :->

T-online gave 10MB, nearly enough for a homepage..
but not more. Isnï¿½t enough to upload all.

Other webspace cost extra. Anybody like to pay it? :)

I try to translate some english pages into german. Most of the german
results are unredable :) I doasnï¿½t check to translate german into
english.

Regards, Robert

I'm aware of the first two. However, I've found BC-FORTRAN to have some pretty large numerical errors and be a little too basic for me (I need some make and debug tools). And I've also heard Prospero can create numerical errors too, although I've never used it. I was unaware of an Absoft compiler, though.

Does anyone know where to get the two commercial compilers? I have never seen either one for sale. I'd like to try them, but I'd also like to get gcc working too ;-).

> STE's clock is gone, removed altogether. I've looked inside, but see
> nothing to indicate where the battery goes or what battery is needed.

The origional is a lithium battery, 3.6v, supplied by Tadiran. Also used in
the TT.

I have both machines and have checked. It's a square section jobby with
velcro and a flying lead.

The part number is xxxxxxx T L 5242 / W. The T L 5242 bit seems to be the
identifying info.

(pasted.)

Ahh, been doing simillar, looking at a half gutted mega as we speak. on the
right hand side of the mainboard, under the row of jumpers, you will see a 3
pin socket, labeled j401. That is it. You plug in a 3.6 volt battery,
obtainable from most PC shops, and plug it in. Ground is to the front of the
board and positive is to the top;-)

Mark
Yup. right under the lip of the top cover.........next to the SCSI
board......

It is listed in my UK trade catalogue so should be available at
any good PC store since it ain't Atari specific.

Price.....take your credit card or a £20 note, you should get some change.
Ring around first.....I don't stock it.

Barrie at Keychange.

Don't use HD floppies. Use Double-Density disks. HD floppies might not be readable on ST's (I don't have my old 1040 anymore, so I can't check that). However, DD disks definitely are.

Let me add that I burned an audio CD on my Hades060 at 8x speed with
a PlexWriter 12/4/32. Not to shabby for an older SCSI bus. ;-)
I await the updates as well, the software indeed does what it
says it will do, and great support.

From: Andy aka 'wim' <studio_fm@poczta.onet.pl>
Message-ID: <99ir6figa1@news.onet.pl>
Source record: 48496

Hi,
I'm desperately looking for a non-cracked, copy protected copy of
Steinberg's Synthworks SY77. I'm working on a quite old-fashioned set-up and
the only copy of the editor has finally got crashed... I've been the legal
user of this soft and do hope someone still has it in the corner of the
studio. If you can pass me a copy - I will be grateful.

Thanks and regards,
Wim

Hmm, can't find these. I installed Scripter into C:\Scripter and it
also put some files in Gemsys\magic\Start. Files were scripter.app
and 3 or so folders called Plugins, Libs and Autosic

>Now, when i first installed Jinnee on my system the context popups
>didnt work properly, so make sure you have the folder structure
>
>C:\Jinnee\Jplugins\context\
>
>and put all Jinnee's .SIC in here, probably found in a folder caled
>zusast.

There are quite a few *.sic there but if I hold right and go down to
plugins it doesn't show any.

I installed *.sic files to call up Scripter which works fine.

It's quite difficult as it's on another IDE so I can't keep on
switching back to often.

Hi Derryck,

DC>There's a typo at the end of the English text "corected" which I have
DC>;-)
that was our intention as neither Hans-Peter nor me are native
English speakers.

And furthermore I'm sure that Hans-Peter welcomes any stylistic
improvement you might do to our text.

DC>Thanks for this
Don't mind about!

DC>I'll announce it when it's ready for download! :-)
But please don't forget the exclamation mark behind 'For MiNT users
only!' or something similar! :-)

There's really no use for racing after the highest version number...

Anyway, have you got an impression of how many copies of the preceding
versions had been donloaded? Just to know how many people are still
interested in Atari software.

E.g. from Maus SU2 BBS there were 28 downloads of the 2.9 (no x)
version...

Und TTschï¿½

For me the same: allways MagiC first and then
NVDI. And if you're using a graphic card then
both of these should be after the drivers for
the card. I've tried several options and now
that I have XBoot placed after Magxboot and NVDI
it even pops up at my non Atari screen. This
screen is been 'lit up' by a Nova Graphic Card.

Watch out for some strange things that XBoot
sometimes shows: it will change (very rarely)
the order in your autofolder.

Try and succeed!

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 1 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

Hi Ken,

I have his e-mail address and did exchange e-mail with him about 2 months ago. However he did not reply to my last e-mail or the 2 followups to it. I guess he is just busy.

Any how if you still need he e-mail address then send me a e-mail and I'll pass along the one I have.

Sorry to hear about your Apex disks, I've had a similar problem with mine. I did get them back, but the main installation disk was damaged.
Doug did e-mail me the latest version 2.41. However I have found that it does not work on my RGB Monitor! Works fine on my CT2B Falcon with a SVGA Monitor.

Doug may help you out as well.

Someone told me that v.2.41 has a bug and will not work on any RGB Monitors!

If anyone has version 2.41 working on a RGB Monitor then do let me know. E-mail me what model of RGB monitor you are using and any upgrades to your Falcon. phantomm@bellsouth.net

>nope,sorry.
>my latest version is 2.3 i believe.

Nice to see a posting from you Dan!

I've been using the lastest version of GENEVA and NEODESK on my Ataris for
along time. Along with STALKER and STENO. All Bought Brand New except for
Steno which I bought as a used Original.

All work Great on my CenTurbo II B Falcon!

I've been hoping for an upgrade to GENEVA and NEODESK is there anything
we can look forward to?

3976. MegaSTE and FPU

Newsgroup: comp.sys.atari.st
Date: 2001-03-24 22:18:41 UTC
From: phantomm@bellsouth.net
Message-ID: <539v6.686$X_.51473@news2.atl>
Source record: 48504

After reading a thread recently regarding installing a FPU into a MEGASTE,
I got abit confused on just what needs to be done.
I have a TOS 2.06, Internal HD, 1.44 disk drive MegaSTE with a ATONCE
VORTEX 386SX board installed. The Vortex has the Optional 512KBs of FAST-RAM
but does not have the Optional 80387SX CO-Processor.

After looking thru the Atari MegaSTE manual it just mentions that a
68881/2 FPU is Optional. I am not sure if my MSTE has one installed or
not, just haven't checked.

But If I ever want to install one, what exactly do I need?
I always thought that the FPU its self was all needed, but after reading
the recent thread on the subject I'm not sure?

BTW, if you happen to have a good 80387SX Co-Processor at 16mhz that
you don't need, let me know.

3980. Misc ST HW + SW FS (USA)

Newsgroup: comp.sys.atari.st
Date: 2001-03-24 22:58:18 UTC
From: Fred Horvat <fmh@netzero.net>
Message-ID: <3ABD268A.536164DB@netzero.net>
Source record: 48507

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks
$10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$45.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk
$15.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
Sept 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run.
$20.00

WANTED

MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, Mac, and Amiga. If interested please request a list.

If you've the hardware key, I've got the original disk of the Steinberg's
Synthworks SY77 1.13 version ...

If you're interesting to send you the archive by e-mail, write to me ...

From: ag352@chebucto.ns.ca
Message-ID: <99jptilml1@News.Dal.Ca>
Source record: 48513

I was able to restore the clock in my Mega STe by going to a computer shop where they sold me this thing that held 4 AA cells and had the same little 3-pin connector. They said that to try just two, then try three, and if that didn't work, go to all four. It remembered the time through unplugging with all the various attempts. I like that.

The clock battery died in my TT about a month ago. New batteries are
available from Radio Shack. Go to www.radioshack.com search for part
number 960-0012. This is a 3.6 volt lithium battery Tadiran TL5242/w
with the correct connector and velcro to attach it with. Costs $12.99.

>Many thanx
>

One thing to check when you have problems like this:

Run an Atari virus checker on the disks.

An Atari boot sector virus which in invisible when in the Atari can
change the boot sector enough that the PC will not read the disk.

Put the disk in the Atari, you can read the directory just fine. Put
it in the PC, it won't even try to read it. Put the disk back in the
Atari, you can read the directory just fine. This means the boot
sector has been damaged by an Atari virus.

Hmm, it's been a while. I know Newsie couldn't delete files and it
also never displayed the names of the files. aFTP just didn't show
them I think, I could be wrong though.

Hi

this is what Ive got so far:

Your best bet would be to try out an Atari ST emulator and see if you can
read
the disk. Try the sites below:

http://www.pacifist.fatal-design.com/
http://www.atari-computer.de/mjaap/computer/english/index.htm

You may also want to check out Gemulator. Now if these programs do not
work, the only other option would be for you to find an Atari computer
owner who will be be to read the disk and transfer it to PC compatible one.

Good luck

Sel

Create the BIN folder, some scripts require binaries, such as
TAB2SPACE.ttp, touch.prg and expect them in /bin/

>>Now, when i first installed Jinnee on my system the context popups
>>didnt work properly, so make sure you have the folder structure

>>C:\Jinnee\Jplugins\context\

>>and put all Jinnee's .SIC in here, probably found in a folder caled
>>zusast.
>
>There are quite a few *.sic there but if I hold right and go down to
>plugins it doesn't show any.

They are context sensitive, so you'l get a different set of plugins
depending on whether youve right clicked on a registered archive type or
a text file or a folder, etc etc. Clicking on a drive icon you should
get 'Search' and 'Touch'

>I installed *.sic files to call up Scripter which works fine.

Thats good, but if Jinnee can find its scripts in the correct place then
/it/ wil pass them to scripter itself.

>It's quite difficult as it's on another IDE so I can't keep on
>switching back to often.

Time to get organised, install things as i said or you'l have grief, and
then get back to me.

>Nope, move it to where i said.

But the installer already put some files in gemsys\magic\start. Well
OK, but how do I deinstall. Are any inf or cfg files changed when
Scripter is installed so I can change them accordingly? So in the GEM
setup install path I type C:\GEMSYS\MAGIC\START ?

>>Files were scripter.app and 3 or so folders called Plugins, Libs and
>>Autosic
>
>Create the BIN folder, some scripts require binaries, such as
>TAB2SPACE.ttp, touch.prg and expect them in /bin/

Why cant the setup program do this. Seems pointless including one if
you have to change it all. So I create a folder called Bin in
gemsys\magic\start but what do I put in there?

>>There are quite a few *.sic there but if I hold right and go down to

I just realised you had to hold right over an object of some sort. I
was doing it over the desktop. Oops...

It works OK now, I managed to pack a file using the ZIP plugin.

>>I installed *.sic files to call up Scripter which works fine.
>
>Thats good, but if Jinnee can find its scripts in the correct place then

Hi Bindon!

I don't think it matters (but I'm no expert on this).

>I'm gonna have to get started with Scripter but don't seem to have a
>manual sent to me. I suppose it's online then?

The Scripter manual is in the form of an ST-Guide hypertext, translated
by yours truly... If you prefer it on paper, you can always print it
out. A wide range of scripts is supplied in the package, which can be
used as examples for writing your own. There is a separate (linked in)
hypertext describing the GEMScript protocol, GSCRIPT.HYP, that should
be supplied in the bundle.

Regards, /Peter/

>zusast.

Originally that would have been ZUSATZ but in the English release that I assembled for AW this folder has been renamed EXTRAS. But as far as I know the scripts are all in the DEMO folder and work fine from there (not in ..\plugin\context\). And note no 's' in 'plugin!

From the HYP:

After installation the following structure will be found on the disk:

autosic\
demo\
guides\
gscript\
plugin\
libs\
tools\
history.txt
readme.txt
scripter.app

To complete the installation, it is strongly recommended to install Scripter in the desktop as an application for *.sic, which makes scripts operate as if they were normal programs.

>When youve done this and al seems to work, get back to me, some of
>the included scripts are poxed, some are duplicated. I'l send you
>some corrected/modified scripts.

I thought I had removed all the duplicated scripts, apart from those in the AUTO folder.

>both systems. There's also a program (I forget what it's called - anybody
>remember?) that allows the ST to format PC-compatible disks. It's a matter
>of some FAT info being slightly different.

Some modern PCs seem to have problems formatting DD disks. HD disks can
be formatted to DD but I am told the data is not reliable when read on a
DD drive (like STs) though it should be OK on the HD drive of a PC.

Actually the relevant difference between the early TOS and DOS disk
formats is only in the first two bytes of sector 0. Where Atari had (all
values in hex) 00 00 {or there could be instructions to branch to
executable code here for self-booting programs such as games} the PC had
EB 2C for DOS 2.0, EB 34 for DOS 3.3 and 69 00 on later versions. TOS
from 1.04 on formatted disks in a DOS-compatible manner.

If you have a disk monitor/hex editor for the PC you could try changing
these first two bytes, after which the PC should be able to read the
disks. If you still have the Atari - or can get access to one - there is
a PD program DISKMOD.TOS, an ST to IBM Disk modifier by J D Eisenberg
which is used together with a file BLOCK0.DAT to write an IBM boot
sector to old TOS disks *without losing the contents* (the BLOCK0.DAT
file is actually an image of the required boot sector).

Does anyone know by experience which EPSON
printer is a good replacement for the stylus
Color 500? Mine has a colorproblem: all colors
except yellow is working and the firm who
imports them says it is mainboard problem. That
means that any repair or replacemnt might be
more expensive then buying a new one.

But the new on should also have no problems with
Calamus 2000, Papyrus and all the other usual
Atari programs.

Thanx in advance,

Raoul Teulings

>english.

I think you do very well on the whole, Robert. But (if you don't already do so) I suggest that when you translate English to German, you leave the original in the archive as well. There was certainly some English in the previous version I had from you.

I have installed Mint and Toswin on mt Ste with 4mb RAM and 30mb HD.
Whenever i try to load programmes(any programme) i get the following:

pid 2(Thing Desktop):Privilege Violation.etc etc
pid 4 (Storm(programme)):Address error.etc etc.
pid 1(GEM):Address error.etc etc.
exit code:2816
Leaving Mint

Any help would be much appreciated.

So what's this Gemscript stuff all about? I thought that was some
sort of freeware/shareware alternative to Scripter. Hmm, this is
confusing.

I have a feeling Steve may be using a different release version
because his seem to be totally different. What you've said Peter
seems to make sense.

So how do I check if everything works? Jinnee plugins seem to be working
fine, and if I double click on a demo sic file it carries out that
script perfectly. Is there something else I'm missing out on?

> I remain curious of ways to pass the 4 meg barrier on the ST.

Apparently there can be several approaches to this problem:

1) Try to find a (not anymore available?) MagnumST card which adds up
to 12MB of ALTERNATE RAM and TOS2.06, or some other card with
similar functions. Seems like a perfect solution, if you can get one.

2) Try to make something yourself, if you are skillfull:
2.1) There were reports once upon a time of a hack with added a lot of
real ST RAM but I have heard it was very complicated and required
many chips and a lot of cutting and soldering, and was quite
expensive.
2.2) Design something from scratch using standard cheap DRAM memory
modules, for which you would basically need address decoding
(relatively simple) and a DRAM controller (which makes things more
complicated) but which can get you about 12MB of ALTERNATE RAM
(you will need TOS2.06 to use it).
2.3) Design something using SRAM memory chips and make ALTERNATE RAM.
You will need TOS2.06 too, and the hack will be quite simple
but it will get exceptionally expensive (about 100DEM/MB) and
doesn't make much sense, except if you want to add just a little
RAM, e.g. for resident programs.
2.4) Try to adapt some old memory expansion board from another platform
(PC? Amiga?) The board would probably contain a DRAM controller,
but decoding the proper addresses and control signals may be tricky.
You would also need TOS 2.06 to use it.

Strange, it seems that in some computer configurations Newsie works
quite properly, while on others it is unusable. Of, course, a really good
program should not be so picky about the platform it is being run on.
I use Newsie 0.961 on a MegaST with TOS2.06, and it runs fine (everything
works: ftp, mail, news), better than any previous version- a lot of bugs
have been removed, though I notice some- rarely.

Thanks!

The BBS scene died *everywhere*, sadly :(I brought mine back
since i've been working at it for years, and thought it'd be cool to keep
an ST BBS online forever. Sicne its telnet based, and I keep a machine
online anyway, its not that much of a cost. I just hope it catches on with
the Retro crowd.. since I believe a BBS really does have a lot to
offer. It just needs users to start in the message bases, and then life
will return.

Tell all your friends :) We need users badly!

Early TT's (usually the 2-fan models i.e. rev.B) used a 6 volts
battery, while later models and MEGA-STE's used the 3.6 volts.

I actually have DynaCADD laying around, but I hate to install it
just to toy with some DXF files. I have Rosetta, part of the
Phase4 stuff, but it does not convert correctly (parts of objects
get left out) or it completely chokes (bombs or freezes up).
It's not critical I find a tool, just that I wanted to send
a freind some old objects I created years ago. :-)

Easy to find polarity just shove a multimeter on the pins and check for
contiuity between grnd, this will obviously be negative;-). I think it does
recharge. These batteries are very easy to get hold of new, from most
electronics crowds.

Sorry for the delayed reply here.

The only full release seems to be Texel v1.60r5 from Atari Workshop,
but it doesn't handle the graphing functions. It does, however,
integrate with Artworx, which is available from the same vendor
(v2.09) when used in conjunction with OLGA.

The main problem is that basic Excel import/export functions only came
in with the v2.x versions, so if you're looking for interchangeability
from home to work you're a bit stuck unless you can use the more basic
import/export formats.

Yup, I've finally received HDDriver v8 with manual from Atari Workshop
too. If anyone else has been waiting, go get 'em!

> ...Doom using the VDI actually work and was slightly quicker,
> although still unplayable (really need a TT upgrade).
Blimey!

> 1) The Redirect program does not appear to do anything, I get no
> redirection and have to guess my way around SELTRES (or whatever
> it is), should I not get all of the boot sequence after the
> Redirect prog has run (it is the first in the AUTO)?

Let me make sure I'm understanding you. If Redirect doesn't work, then
you're saying you only get a screen image via the normal Atari monitor
port. If that's true, then you can't possibly be getting a 32k colour
depth. Redirect only redirects the monitor output through the graphics
card AIUI. If you're getting 32k colour depth the, by definition, the
monitor must be connected to the graphics card. Therefore redirect is
working.

Have I misunderstood something?

Second, when you say SELTRES I guess you mean CHGRES - right? Are you
using the Magic version of CHGRES or the replacement version provided
with NVDI (named exactly the same, but a different size - 18338 bytes).

AIUI you should have installed NVDI after Magic so that the NVDI
version of CHGRES is in effect in C:\GEMSYS\GEMDESK\

If you don't mean CHGRES, but SLCT_DEV then, even though the above
still applies, the answer is different. If you're using Magic the
SLCT_DEV should not be used - CHGRES completely replaces it.

That said, I found that if SLCT_DEV has been run even once, then
CHGRES stops working unless you go to the directory on the desktop and
double-click it from there. After that it'll run from your desktop's
Change Resolution menu entry ok. Does that help?

In answer to your actual question, yes you should see the rest of the boot on screen after Redirect has run. But, also note that even though you are using the graphics card some screen output will still be forced through the old monitor port. Most significantly, this will include any error message produced by NVDI if an error occured in its installation! This is very significant if you have a faulty NVDIVGA.INF!

If it's possible to have two monitors connected at the same time you will save yourself a helluvalot of confusion (believe me!)

> 2) Viewing documents in TOS just produces funny graphics on the
> screen, is this related to the above?

Do you mean TOS programs that don't output via VT52.PRG? In that case, it's normal. Redirect is sending the output through the graphics card, but the program doesn't really support the graphics card and you will get a screwed up screen. The most obvious example of this is UUDECODE used via Newsie B<

Note the output and do a screen redraw. You just have to live with it when you have a graphics card, unfortunately...

> 3) Why did the program select 62Hz when I told it the monitor
> worked from 65-75?

Where are you providing this information? Within VMG4000? If not, where?

> 4) I selected a Crazy Dots VME card but it said the hardware was
> not responding, is this normal? Could I have a CD II card? How do I
> identify it (I know it has a 15Bit extension)?

If you're getting 32k, then that's 15-bit colour depth, which could either be CD1 or CD2. What have you set up in your C:\AUTO\NVDIVGA.INF file that was output from VMG4000?

I ask that question deliberately, because I know there's nothing in the NVDI manual that tells you what this program is for (it creates your resolutions for each colour depth and makes them available from the Change Resolution in your desktop. Do you have one at all? (I don't know what the default setup is with a fresh NVDI installation).

there are several free players for Linux, e.g.
http://xine.sourceforge.net. They play unencrypted DVD's only, though.
Of course there are illegal sites with illegal plugins that do the dirty
work so you can watch even the encrypted disks :-) But the player itself
is under GNU GPL and is free.

Forgetting about Magic for the moment, I have disabled it.

I would expect the Atari logo, etc to be output on the standard monitor (as it does), however my understanding of the REDIRECT program is that the output from the point it is run will be sent to the graphics card. Then a few other AUTO progs run (with no output) and then the SLCT_DEV program, the one which lets you select resolutions from your INF file (yes I have managed to make one no problems), and not the Magic one. However I can not see what is going on with the SLCT_DEV program so I have to guess may way round to select a resolution or set it to delay for only a second or two.

> In answer to your actual question, yes you should see the rest of the

After REDIRECT nothing until SECT_DEV is run, INF file no problems. The answer would be to run SECT_DEV right after REDIRECT but the problem still standard that I can't see what I selecting.

> If it's possible to have two monitors connected at the same time you

Have been doing that to set it up but there is not enough room for it to permanently be there.

> used via Newsie B<

In TOS (not Magic), double clicking on a text file (e.g README.TXT) produces
a screen of characters which simply look to be made of horizontal lines. I
am not trying to display a resource file or other code, these are standard
ASCII file. The kind of effect I would expect from it not pointing to a
bitmap character set but rather a random bit of memory.

I selected CD VME in the VMG4000 prog but I have not done anything with its
more advanced settings.

Fresh NVDI is basically TT resolutions but on the Graphics Card, AFAIK. I
think I created a three 800x600 resolutions in deferent depths.

Hope this explains it all a bit more.

My brother offers free unlimited webspace and unlimited FTP uploads on his server for any Atari site, it is a rented server so it is quick and maintained. He only asks that people do not put copyright software, porn, etc on it, and (ideally) have a domain name although if there is interest he will purchase a domain for an Atari community to use (like Atari.org).

>only!' or something similar! :-)

Good point, I'll do that.

>Anyway, have you got an impression of how many copies of the preceding
>versions had been donloaded? Just to know how many people are still
>interested in Atari software.

Unfortunately I don't get a log file from my web site (I simply haven't
bothered!), although I have toyed with the idea of moving all the downloads
to an FTP site which was to be for a project long-since abandoned. I'd get
a proper log from there.

Incidentally, I understand that the Optimizer will not work with a 4G drive
with a single (F32) partition, as supported by HDDriver 8 and (I think)
MagiC 6.10 from the report I've just had. Will there be a chance for
another upgrade?

4045. SLM 604 printer with a Spectre GCR setup

Newsgroup: comp.sys.atari.st
Date: 2001-03-26 14:24:16 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <000b2106@fmlynet.org>
Source record: 48397

FamilyNet Newsgate

Hey there Dave Small fans. :) (Creator of the Spectre GCR)

Currently playing with Spectre GCR. Have a fun setup going, and naturally find myself not only enjoying the computer that I sorta wish I was more into during it's heyday (The Atari ST) but on the same ST I am able to enjoy the programs I enjoyed for the past ten years (on a Macintosh Plus).

Guess you could say the past seven years on the Mac Plus was getting me ready for the ST platform. (grin)

Anywho, having lots of fun seeing what games work on it. But a printer would be nice.

The Spectre GCR manual talks about getting a SLM 604 printer working on the Spectre setup. The ability to screen print with the SLM 604 quality, or print from the Mac using the ImageWriter printer drivers.

I have the SLM 604 working with Page Stream. I'm thinking when it comes to Spectre the printer needs to have a ID setting of 5 or 7 to work, but I'm not sure.

Does anyone have a Atari laser printer working with their Spectre setup that can shed some light on this?

Thanks,

Doctor Clu

Atari Workshop don't sell Emailer or fiffi (the latter gets IFusion bundled

with it). You'll have to get them from ASH.

Both these programs are GEMScript/Scripter aware - you can fully automate
your online activities (CAB is not a GS client though), including multiple
ISP mail and news collection whilst remaining connected to your main ISP.

Yes, you are the second one this year they ask for splitted archives :)
Well, doit_st is huge, sure. I will think about smaler parts for the
next update.

> When I get round to it I'll send you DM 15 for the CD - will that have
> the latest versions?

Yes, anytime a empty cd arrived i burn the latest release.
ZIP disk also welcome.

4055. [HELP] Opening TT030 Case?

Newsgroup: comp.sys.atari.st
Date: 2001-03-26 16:45:51 UTC
From: Chris Martin <cmartin@ti.com>
Message-ID: <3ABF723F.3E3AA89D@ti.com>
Source record: 48485

All,

Well, this may seem like a simple question, but I thought I would ask before I blindly go mucking around inside my TT030. How do I open the case? I know that there are 4 screws along the outside edge of the case on the bottom. There are are at least 4 more screws, one big flathead underneath the harddrive. and one that is covered with a sticker that says "warranty void if removed". Hehehe. I am not too worried about that since I am sure I have voided the warranty (if it still exists) on all my Atari stuff anyway.

The reason I am asking is I would like to add memory to my TT030, and I need to see what is inside. I would like to add memory because I am setting up my TT030 with Debian Linux to run a multi-user telnetable BBS. It runs fine at the moment, but more that 8Megs would be great.....

Thanks for the help,
Chris

Might anyone have this available to perhaps purchase? I've got Dr. T's KCS, and while it works, I am still rather clueless on its intricacies. I've heard Pro-24 is far easier to use. I've got an old '89-model 1040STe, so this needs to be the old old version..

Thanks in advance.

Hi,
ONCE, and one time only, my Lynx II powered up without the cartridge. It
requested that I insert a cartridge in big, orange letters. I had my Lynx
about 2 years at the time. It never happened again. Don't know why.
On a totally unrelated note, I was actually trying to get that self-same
message to come up when my batteries ran low. I got out my power adaptor
with the four different plugs at the end; I stuck it in my Com port by
mistake and...let's just say my Lynx has been lying dead in a drawer for the
past four or five years.

aftp do have some problems espically the STing version. I have found
that v1.55 does not work properly with STiNG/STik. If I use STik/STing I
return to v1.44.
With my MiNT-net setup I was able to use v 1.55 without any problem
until recently. However since I use the cable to surf V1.55 starts
giving me severe upload problems. Usualy I can upload only 1
file/session. For the moment I using 1.53 and so far everything goes
well.

I was thinking, for more of an educational experience I should try
adding just 512kbytes of SRAM. The good points are that it's dead
simple and that it's amazingly fast with a speed up processor eg in a
Mega or on your own speeder board. I'd just be worried about this odd
problem of the video ram trying to be placed there.

Hi,

I've still got a few boxed copies of Pro 24 III left (1meg STE needed).

I'll let you have a copy for the price of the postage. as your in the USA.

I normally charge £5 inc P&P for UK (anyone else want a copy?)

Let me know

GEMscript is the lingo that is being spoken, the language of the
Protocol..

BTW, look in the Jinnee menu bar, theres an option under "special" where
you can train Jinnee to perform quite complex tasks that result in a
script for future automation of whatever you taught it!

yes stealing Atari programs is bad, unlike stealing Microsoft products which
is good

IMO your suspicions would be correct. The NVDI setup needs to be
different on a Magic enabled setup compared to a TOS setup.

Steve's suggestion for the setup order looks like the wisest move to
me.

Undo the slotted screw first. It's captive, so it won't fall out. Take out the hard drive bay (lift at the front slightly and then pull forward) and remove the ribbon connector from the hard drive (note the orientation so you put it back right when you've finished).

The ST RAM expansion area is immediately visible beneath the HD bay - I've never seen an installed board but AIUI it screws into the posts that are sticking up.

> The reason I am asking is I would like to add memory to my TT030,

> than 8Megs would be great...

For access to the TTRAM area, undo all the rest of the screws, prise the top off - the area at the back where all the ports are is the tricky bit. If you still have shielding it may be in several parts if it's like mine. There may be one for the fan and another for the PSU, which both need to be removed first by straightening the twists of metal. Finally, remove the main part of the shielding and you'll see the area for TTRAM in front of the PSU at the bottom left. There's one screw and then just a plug to the motherboard if you need to remove it, but depending on the board you already have you'll have banks for eiter 30-pin or 72pin SIMMs you can plug in.

Again, depending on the board you have, you'll have to flick dipswitches on the TTRAM board to make them recognisable by the TT.

That's basically enough for you to get going...

This is definitely a bit wierd and shouldn't happen. Am I right in
thinking you've never run with a graphics card at all? IIRC I needed
to do a ruthless job of weeding out redundant and incompatible Auto
progs and accessories when I first started. I can't think what would
be screwing up the boot so early on with what you've said up to now.

Can I ask for an Auto and ACC listing from you? Also, do you use a
boot manager that may still be messing around with your setup? It may
be worth starting from the basics and building up.

>> In answer to your actual question, yes you should see the rest of

I'm thinking lots of things atm. If you're saying that SLCT_DEV doesn't show up on the screen through the card then I'm returning to the thought that there's something wrong with the NVDIVGA.INF file. Does NVDI run immediately after REDIRECT? The INF file has to be valid for it to proceed with the boot through the graphics card. I'm suspecting that there really is something wrong with this and whatt you've said later seems to back that up.

Look at C:\NVDI.INF and add a line like:

LOGFILE = C:\NVDILOG.TXT

Try the boot again and see what it says. It may give a clue.

>> If it's possible to have two monitors connected at the same time

It's quite possible (but not entirely advisable) to switch a single monitor from one plug to another during this process, but while you still have a problem you'll just have to make some room for a while if you want to get the setup working.

>>> 2) Viewing documents in TOS just produces funny graphics on the

But the desktop itself is ok? What about if you try to load the file into a viewer or text editor? Is it the same? What settings do you show in NVDI's compatibility CPX? I use GDOS, GEMDOS text, Line-A and Error messages (not TOS compatibility).

> I selected CD VME in the VMG4000 prog but I have not done anything
> with its more advanced settings.

My Iiyama 15" allows 30-65 kHz horizontal and 50-100 Hz vertical - is yours really so limited in range? Are you getting the two mixed up? If not, this may be the cause of your problem. Secondly, you may be using a CD2 card instead of CD1 card. Third, I'm not convinced the settings provided for either card are correct. In this case it may be necessary for you to run Detect Dotclocks from the Special hard menu option in VMG4000 and start again creating some basic resolutions.

Did you test the resolutions in VMG4000? Did the test card display ok?

> Hope this explains it all a bit more.

I understood a little more, but I think this is going to drag out for a long time unless we have a long chat about it and try things out while we're on the phone. Let's go to Email and see if we can't report back when we finally solve this problem...

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 30th, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

5,000 square feet of indoor space and an additional 5,000 square feet of
outdoor space is available along with ample parking.

Setup: 29th, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

As of 03/26/2001
User Groups:
Erie PA Atari Group
TI Chips

Cleveland Classic Atari Group

Vendors:
L.R.O. Computers
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
Fred Wagaman
Alan Hewston
Thomas Mclaren
Andy Frueh
Classic Gamer Magazine
Curt Vendel(Atari Historical Society)
John Litva
Possible Attendees!!!
Atari7800.com

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room- MAME, etc.

We already have one person bringing a Crazy Climber cocktail arcade game, John Litva. Please email us if you wish to bring an arcade game to the show.

See ya at the CCAG!

What is the source of the DXF files you are experimenting with? With each new release of Auto CAD, new features were added and so the DXF files that were created with each new release changed. Supposedly, newer Auto CAD releases are supposed to import older DXF files, but don't believe it. <G> Been there, done that.

Message-ID: <20010326224022.22340.00000243@nso-cf.aol.com>
Source record: 48412

Hi everyone,

I would like to add a battery to my 1040ST so that I don't have to keep resetting the time and date everytime I power up. I was wondering what my options are.

I'd really prefer to keep my cartridge slot free for dongles, Spectre GCR, etc. I remember one a looooong time ago that actually fit under a TOS ROM. That's the one I would like to have, but I'm sure the manufacturer is gone by now.

Any help is appreciated.

-Phil

Presuming you have the TT upside down...Beware.

Hold the harddrive carrier in as you turn the TT over or it will almost
certainly fall out, possibly damaging your cables.

Came back into the Atari scene in 1998 after dragging my Atari 400 out of
the closet. Met up with a local Atari group at the time, and became the
newsletter editor and thus got hooked on the Atari ST. Since then I have had a
blast with getting the Atari ST 1040ST /AdSpeed to emulate a Mac with Spectre
GCR, printing newsletters for a live action medieval renessaince club I'm a
part of, some games, and internet programs like CAB (though the connection
script has not worked lately because my provider recently changed it's format.
:(Oh well.. just need to get it setup again.
Fun to tinker with something that if it breaks, will not be life
threatning.

> After looking at all that I would have to do to finish this total hack, I
> stopped and thought about it. What was I trying to do?

"Push the envelope" as Dave Small would have said. This was a common
phrase he used as he was writing the Spectre GCR emulator for the ST, not
knowing if it could be done, but trying it anyway. As it turned out, he made a
pretty descent emulator. One that could run a Macintosh Plus... the
contemporary machine of the early ST's, at something like 40% faster than the
original speed! Now that is unheard of most of the time for a machine to run
another peer's machine's software at a FASTER rate. :)

> I was trying to
> get this machine up to some kind of usable condition, so that I could use
> it along side of my IBM PC (an Athlon 500 with all the bells and whistles).
> Is it worth it?

Good brag value... fun to say you use a Atari computer. The reactions of
other people make it worth it. ;) I'm in the classic Mac club for example,
and I am the "Spectre Macintosh user" since the Spectre was considered to be
one the early Macintosh clones. So therefore, my setup is more than welcome
there.
And of course that live-action fantasy group gives me the funniest
reactions when I tell them the newsletter they just read and loved was printed

on a Atari ST. :)

> Or should I just restrain myself, and play with emulators?
> David

There is some value in emulation. For example, MagicMac allows you to use a all on one unit of a Macintosh Performa 575 (for example). Here you have the exact reverse of the Spectre setup where the Atari ST emulated a Mac. Not you have a Mac emulating a ST. And it does so with blinding speed. Another emulator well written (probably inspired by Dave Small) ;)
Pros are... no hardware upgrade time, the programs run fast, most applications work, you can hook up a true ST external hard drive and access files off of it... really nice!
But the problem I've run into is having to figure out problems and then deduce wiether it the Atari environment, the ST emualtor, or both? Printer drivers are a pain, sound is non-existant, and many programs flat out refuse to work.
There are better emulators out there, but it is that second guessing of which is the problem that gets old. For me at least. And in the end, what do you have? A computer trying to be a ST.

In the case of the classic Mac group, I am not there to be a Mac user... but a ST user trying to find ways to improve his Spectre setup. I'm an Atari user in a Macintosh group getting by on a technicality. And the same is true for a PC/Mac user emulating a ST. Nothing wrong with it, but it is still fun to get those reactions from people when you say "Yeh, I did that on a Atari computer."
"A what...? Wasn't that a game system...." Heheheh....

Take care, let us know what you decide.

I tried doing a FAT32 system on my Magic 6.10 a few weeks back but
never succeded due to not having manuals etc. IIRC I partitioned the
drive using HDDriver v7.8 to F32 system but Magic didn't like it.
Maybe Magic has to be configured for it? Anyway my drives aren't big
enough to bother and I no longer use 6.10.

Ages ago I experimented by keeping the Hitachi keyboard chip alive
with a small power source after the main power goes down. It did keep
the time, and that was the problem, it never actually kept going. If
I boot up it reported the time it was shut down! Oh well, I learnt
something! :)

Hi,

It may be a bit OT but it is for my Falcon. I need a very small
piece, about 4 inchs of 0.635mm (0.025") ribbon cable for a IDC style
crimp. Farnell only sell by the 30 metre reel and Maplin have
stopped selling it. It's for the SCSI 2 port.

Any one know a source or have a scrap off cut?

Thanks again.

4112. Re: Battery-powered clock for 1040ST

Newsgroup: comp.sys.atari.st
Date: 2001-03-27 16:23:43 UTC
From: chris.crosskey@metrics.co.uk
Message-ID: <609562B7721BD41187B400B0D020856035C9ED@FILESERV>
Source record: 48438

I don't think there's a way of doing this I'm afraid.....there isn't a seperate power feed to the memory (what you'd need to do is to keep the RAM powered up) without powering up the rest of it......easy way out is to not turn the ST off....that said whenever it crashes yo'd need to re-enter it anyway....the way battery-backed clocks worked was to plug in either to the cartridge port or (In the case of the TUS STe-RTC) the enhanced joystick ports, and have an RTC that was battery backed so that when the system powered down, the RTC stayed powered up, then an auto-folder program would read the clock and set the time....the TUS one worked well on my STe, back before I got my first Falcon.........

TO seperate the power feeds to the memory (you need to put a diode in there to stop the battery trying to run the whole system) might be possible though very hard, though if you have an after-market 4Mb conversion in an STFM then it would be easier ...use a germanium dioe though, and have a Nicad battery that puts out 4.5V and you should be OK.....It would have the advantage of keeping everything in memory active though, not just the date......you'd have the worlds fastest-booting ST :-))

Lyndon Amsdon:

> I tried the recommended URL but it threw me back to ASH's site

<http://www.application-systems.de> seems to be down at the moment,
but

<http://ash.sww.net/forms/PREISEXP.HTM> is available

normally you can get this site by clicking on the small yellow button called "Jetzt
bestellen" (that
means: order now)

> Anyone know the rough price in either DM

Emailer 2.3 - DM 49.-
Fiffi + iFusion - DM 39.-
Iconnect is part of Emailer and Fiffi

> Is ASH a good place to buy from?

I bought all my Atari-programs since 1988 from ASH and I had no problems in all these
years, so I
would say: yes, it's a good place.

Diedrich

I believe ATA100 IDE hard disks use this size cable. Try a local PC
shop or online trader. You'll probably only be able to get it with
connectors attached, but you can always cut them off. May not be a
particularly cheap solution (www.dabs.com lists one at ï¿½2.50 + VAT),
but almost certainly cheaper than buying a ready made SCSI cable!

I'm trying to get CAD-3D files into DXF format, as I said I have
a tool for this but it just plain crashes on large CAD-3D objects.
The goal was to get the CAD-3D objects loaded into Pixel 3D Studio
(I think that is the name) on a freinds MAC.

>
Use some utility to check contents of the cookie jar. If there is a FPU,
TOS 2.06 will install a cookie _FPU with a hex value 00010000. A program
like SYSINFO can also tell whether the FPU is there. GEMBENCH can, too.

>But If I ever want to install one, what exactly do I need?

You need a 68881 FPU chip (PLCC housing, rated for at least 12-16MHz) and an
address & datastrobe decode chip. The latter one is a programable logic
device and has to be programmed specifically for the job.

4119. PC <- Serial -> Atari

Newsgroup: comp.sys.atari.st

From: Henrik Johannisson <vinco@ebox.tninet.se>
Message-ID: <99qorb$1bu$1@zingo.tninet.se>
Source record: 48347

Dear all Atarians !

I have now tried for some time to get a null-modem connection
working between my PC and my Atari 1040 STE.

On the Atari side I use Freeze Dried Terminal and on the PC
the Hyperterminal delivered by Windows (NT).

I use a "commercial" null-modem cabel and have tested
most configurations but usually sticks to the simplest
like 300,8N1, RTS/CTS=Off, Xon/Xoff=Off.

But I thought I would be able to for example type
something in the Hyperterminal and it should
appear (or at least something should happen)
on the Atari. But nothing happens.

Before I was actually using another "commercial"
null-modem cable but it had some hardware
defect which I think did that not all pins
was connected. But using this cable I could
see that something happend when I pressed
some keys. All keys on the Atari with exception
of the letters (small and large) were transfered
and displayed as a space on the PC. The other
was not transfered. But from PC to Atari there
were response but just junk characteres appeared
on the Atari.

Am I missing something or ? I think this should
be fairly simple. I have done this before, with
the same Atari. But Im a little bit worried that
the ACIA (MC6850) has been blown away
or something. Or maybe that there is two pins
in the serial port which is about one half millimeter
longer in than the rest of the pins. Is there anything
you can do to test that the serial port is working ?
Program, loopback, anything ? Ideas ?

Many thanks !

/Henrik

>I would like to add a battery to my 1040ST so that I don't have to keep
>resetting the time and date everytime I power up. I was wondering what my
>options are.

Me, too. I got plans from the umich site (I think) for an easy modification
to install a real-time clock chip that had a battery built-in. The modification
was: unplug one of your TOS ROMs, plug the chip in, and plug the TOS ROM back in
on top. Easy! It came with some software for setting and reading the clock.
Unfortunately, the chip was already almost obsolete when I got the plans, and
now I can't even find it (a Dallas Semiconductor part, 1216E, I think). I'm
sure they still make parts _like_ this, maybe it's time for an upgrade to the
upgrade!

>Program, loopback, anything ? Ideas ?

To check if the Atari is OK simply connect a real modem and see if it
echoes to the terminal. If it does the Atari is working.

Then recheck if you run the ports at the same speed.

If they are and it still doesn't work connect the modem to the pc, try to
find modem drivers, install them and check if it works.

If it does the only answer is a faulty nullmodem cable, or damaged
Windows install.

If any of the computers are powered from an outlet without grounding you
run the risk at feeding 100's of volts into the serial ports if you
switch cables with any of the computers (or modem without ground) turned
on.

That definitely doesn't apply to MagiC 4.x - 6.x and NVDI 4-5. I've always installed MagiC on top of an existing NVDI-installation, and that has always worked fine (atleast on my TT and ST's).

You have to keep the DRAM contoller alive too to refresh the DRAMs,
then you have a problem because you'd have to isolate all that as
well.

OK, check you have the handshaking and baud set up exactly the same.

If it still don't work you'll have to make a loopback plug. Basically
this plugs in the port and you can use a terminal and whatever you
type will appear on that computers screen. Useful for diagnosis.

I recently made an 8m cable for ST-Falcon (or my 486).
http://www.airborn.com.au/rs232.html

BTW the serial port driver on the Atari is the MFP 68901, but it could
be blown.

Aren't these 2.5" drive connectors 1mm metric pitch? I have one off
an acorn but it's no the right pitch. 44*1mm = 44mm which is the
width of the ribbon.

I just sold a 1040STE to someone who has a 1040 STF. The buyer reported to me that his disks wouldn't work in the new 1040STE, ergo, the disk drive on it was shot.
Store bought disks work fine in the 1040 STE. It seems that just disks created with his 1040STF don't seem to be able to be read or written to in the STE drive.
Is this a drive compatibility issue? The STE has Tos 1.62. Are there issues with disks drives in this Tos having trouble reading disks produced by older versions of Tos?
Any help would be appreciated
Tom

Hi Tom

I would be pretty sure it's the alignment of the head, on the STF
that's causing the problems. Unless he has formatted the disks with
extra tracks. TOS version shouldn't be a prob.

4139. Parallel Port Midi Expander

Newsgroup: comp.sys.atari.st
Date: 2001-03-28 01:45:14 UTC
From: Crackers <bcracknell@sympatico.ca>
Message-ID: <Kmbw6.471406$f36.14806443@news20.bellglobal.com>
Source record: 48374

Hey gang, three questions.

1) There was a device for use with later version of Master Tracks Pro on the Atari ST that hooked up to the parallel port and allowed you to use more than 16 midi channels. Is this device still available anywhere and/or are the schematics to build one available on the net?

2) I believe there was someone who had made it his mission to track down the copyright owners of various MIDI programs for the ST and to persuade them to release their discontinued software as freeware/shareware/PD and then he was archiving them all on the internet. Was Master Tracks Pro ever added to this list (particularily the later version that supported beyond 16 midi channels with this parallel port device) and what is the URL for the archive?

3) What other options were/are available to people who use Atari ST computers as sequencers to get around the 16 channel limitation of MIDI?

I would also like to give a sharp boot to the head to the idiot who never envisioned that anyone would ever in the future have need for more than 16 midi channels. Kinda like the people who thought nobody would ever need more than 640K in a PC.

The computer refuses to power up. It was having all kinds of problems to begin with (just got it yesterday) but I was able to power it up a few times before it just quit. For now, I pulled the power supply out of my spare ST and swapped it in (the new one has 4 megs of RAM) and it appears to be working just fine.

I was just curious if anyone knew where I could fine a cheap replacement power supply without having to resort to watching ebay listings again.

4148. Link 97 intern/HDDriver v8.02

Newsgroup: comp.sys.atari.st
Date: 2001-03-28 04:46:37 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3ac16caf$0$42874$272ea4a1@news.execpc.com>
Source record: 48381

Hello,

I decided to add a SCSI hard drive to my STE so I purchased
a Link 97 intern circuit board and HDDriver v8.02
(STE - standard not Mega - 4 meg RAM TOS 2.06)

I mounted the circuit board in an external case containing one
SCSI hard drive (case is built for two drives) and a standard power
supply.
It took me quite a bit of time, but when I got it all together,
I took it to an electronics technician to have my wiring checked.
(Just to be on the safe side)

I booted and was able to partition the drive and reload my backed up
data.

The drive by itself seems to work very well. (So far)
The problem is when I begin to connect the rest of my devices.

The Link 97 has one DMA IN connector and one DMA OUT connector.
These are external connectors.

Internally is one SCSI connector. This is where my SCSI ribbon
connects to.

From my understanding, the Link converts the ATARI DMA signal to SCSI.
Ok.
SCSI Drive ID set to 0.
CD-ROM set to 1
Floppy Optical set to 2
Syquest Removeable set to 3

I boot up with HDDriver and it will not recognize my partitions
on the SCSI drive set to 0.
It skips 0 and 1 and starts with 2 and 3.

I check the ID with HDDriver and everything is correct.
I go to partition and only 2 and 3 show up.

I don't understand why it says BUS 0 ACSI 0 (ID check)
ACSI 1
ACSI 2
ACSI 3

Shouldn't it say SCSI
As that is what the signal is being converted to?
========
Well the second problem is using the DMA OUT port.

I purchased the Link so that I could keep my SLM804 laser connected
and off when not using it.
I thought I could connect the SLM804 controller to the DMA OUT.
Then go from the Out of the Controller into an SH204 hard drive.
This doesn't seem to work at all.
In fact, nothing seems to work with this configuration.

I suppose I could connecto the SLM804 controller to the OUT DMA on
the ATARI, then from the OUT on the controller to the DMA IN on the Link.
But then I have to run the darn laser even when I don't wish to use it.

My SCSI chords are about 3 to 4 feet long.
Could this be a problem?

thank you for any suggestions.
this newsgroup is much appreciated.

>
>Cheer's Jï¿½rgen

This is undoubtedly the cause of the problem.

There is no compatibility issue between any Atari ST disk drives (with the single exception that a single sided drive, an SF-354 will not read a double sided disk), nor any compatibility issues with different versions of TOS.

The fact that either disk drive will format and write to new disks only demonstrates that the drive is working properly, but does not indicate anything about the alignment of the drive read/write heads.

If both drives were aligned properly, they should be able to read each other's disks. The fact that this cannot be done indicates one (or both) is improperly aligned, undoubtedly caused by wear due to the age of the drives.

I'd agree that the most likely culprit is the drive in the 1040STF, since it's the older of the two systems.

Unfortunately there is no easy solution to getting the newer STE to read the disks formatted by the STF, UNLESS the buyer has an external disk drive available.

With an external drive he could format NEW disks in the external drive, then either read them directly in the STF, or move the external drive to the STF and read them in that way.

Lacking an external drive, I would try formatting new disks in the STE, they trying to write to them with the STF It's just possible they may be close enough to allow things to work that direction, even if they won't work the other way around. IF he can write to an STE formatted disk in the STF, have him try copying the old disks to the new ones in the STF. IF that process works, he should be able to read the new disks back in the STE.

If that fails, he may be forced to use a serial cable link between the two computers to transfer the files, using a telecommunications program to effect the transfer.

The ultimate answer of course would be to replace the disk drive in the STF with a new floppy drive. Most PC style disk drives can be adapted, although it can be tricky to get the faceplates to look right.

This is good for testing, although if you plan to transfer files, it
would be better to set RTS/CTS=ON (on the Atari end) and
Flowcontrol=Hardware (on the PC end). This will prevent dropping
characters in case the buffers overflow.

>
>But I thought I would be able to for example type
>something in the Hyperterminal and it should

You're correct, what you type on one system should echo on the other
system's screen, exactly as typed.

>Before I was actually using another "commercial"
>null-modem cable but it had some hardware
>defect which I think did that not all pins
>was connected.

A null-modem cable only requires a few pins to be connected.

The transmit of one side goes to the receive of the other, and
vice-versa. (Pins 2 and 3)

The handshake pins are reversed (sometimes 6,8 and 20, and 4 and 5).

The ground is connected straight through (Pin 7).

>But using this cable I could
>see that something happend when I pressed
>some keys. All keys on the Atari with exception

>of the letters (small and large) were transfered
>and displayed as a space on the PC. The other
>was not transfered. But from PC to Atari there
>were response but just junk characteres appeared
>on the Atari.

This sounds like results typical of mismatched settings between the
two systems, most likely the baud rate.

Hyperterm can be tricky to get set properly.

Be sure you select "Connect using: Direct to Com 1" (or whatever
COM: port you're using), at the bottom of the "Phone Number" dialog
box.

Then make sure the port settings on the next display match the
settings on the Atari end.

If you have trouble getting the PC end set up properly, you can just
leave it at its default settings and set the Atari end to match:

2400 Baud, 8N1, RTS/CTS=ON

(Sorry if you've already done all this, but it can be non-intuitive to
get it set right.)

>
>Am I missing something or ? I think this should

>in the serial port which is about one half millimeter
>longer in than the rest of the pins. Is there anything
>you can do to test that the serial port is working ?
>Program, loopback, anything ? Ideas ?

That's always a possibility. I've had to fix the serial port in my
original 520ST a number of times.

Generally it's not the ACIA chip that blows, but the data buffer
chips. There's one IC for data in, and another for data out. They
tend to blow from spikes on the com lines, or static discharges,
acting something like a "fuse" to protect the more expensive LSI
chips. Unfortunately they're soldered onto the motherboard, so
replacing them is not a trivial matter. I replaced the chips with
sockets just in case it happened again, which it did.

You can do a crude "loopback" test with a very small flat-bladed metal
screwdriver to check the serial port.

Set the port for RTS/CTS=OFF and XON/XOFF=OFF. Baud rate doesn't
matter.

Look at the serial port on the back of the Atari. Pins 2 and 3 are the Transmit and Receive signals. What you want to do is carefully short those two pins together, to send the signals from the Transmit pin back into the Receive pin so they are displayed on the screen.

Unfortunately, sitting here at my keyboard I can't remember if the pins are numbered from left to right, or right to left on the male connector, but try shorting the second and third pins from either end on the TOP row of pins, then typing on the keyboard (or have someone else do the typing just to be safe so you can concentrate on getting the right pins shorted).

If shorting that set of pins doesn't cause the characters to echo back to the screen, try the second and third from the other end (TOP row again).

Be careful, but don't worry about shorting the wrong ones, you can't hurt anything by shorting pins at RS-232 voltage levels. Just be careful to GROUND yourself first to avoid static discharges, and be careful not to bend the pins.

Not getting an echo can indicate there is no signal coming out the Transmit pin, or that signals are not being accepted into the Receive pin. (Or it may just indicate that you didn't get them shorted well. or had the wrong pins, so it's not 100% conclusive.)

If you have an external modem available, you can use that to do some basic testing too, although shorting the XMT and RCV pins should work.

Incidentally, since you can interchange floppy disks between the Atari and PC, why use the serial connection this way? (Unless it's that you need to transfer files larger than 720K at a time).

Mint condition with brand new screen cable (Stefan Kachele Kit).

Accessories:
- User Manual.
- 64k memory card.
- Genuine Atari bag (rather rare) with multiple places to put cards and batteries, Atari logo on top.
- Serial interface with null modem cable and user manual.
- CD-ROM Portfolio Club Germany.
- Second portfolio only for pieces.

All for UKP 50 (was 60 last time!)

Contact-me by email.

Hello Henrik!

HJ> I use a "commercial" null-modem cabel...

Its sad but true that many of today's suppliers do not understand what a null-modem cable is, and will supply the wrong thing by mistake. Have you tested the cable with a continuity checker for correct wiring?

HJ> But I thought I would be able to for example type
> something in the Hyperterminal and it should
> appear (or at least something should happen)
> on the Atari. But nothing happens.

Another possibility is the line driver or receiver chips in one or other of the machines. Does anything appear in the Hyperterm window when you type on the ST? If not, then the cable would certainly be my first suspect.

HJ> Before I was actually using another "commercial" null
> -modem cable but it had some hardware defect which I
> think did that not all pins was connected.

Not all pins should be connected, but I'm guessing that you were referring just to appropriate pins.

HJ> I think this should be fairly simple.

You're correct, it should be.

Let me know if you need a wiring diagram for the cable.

- Andy Ball.

Tut tut! With the IConnect overlay at least, you right-click on a file and select "Download" from the resulting context-sensitive PopUp. You can have several (I don't know the maximum limit) download sessions running simultaneously. You can also "Autosurf" the web site for later offline browsing...

You can have several ftp sessions open (fiffi) as well as downloading your news at the same time (Emailer). Biggest bottleneck is likely disk operations, unless you've activated the multitasking disk access thingy in MagiC or HDDriver, can't remember which one ATM.

Grab yourself a decent soldering iron (a 25W one should do fine), and
reflow/add some fresh solder as necessary to all the joints on the PSU's
PCB.

Heat often causes these joints to become weak.

A loss of data can happen, for example, because the media the data were
saved on has bad sectors. This is why regularly making a backup is
strongly recommended for any computer platform.
Disk tools like SED, Diamond Edge or DISKUS can probably save at least
some of the data.

No, because ACSI is not the same as SCSI. Link adapters can make both
compatible up to a certain degree, but that's all. You cannot have a
full featured SCSI bus with an ST or STE.

> In fact, nothing seems to work with this configuration.

Watch out for the cable length.

> My SCSI chords are about 3 to 4 feet long.

I have some problems with makedisk, using the command
"makedisk /write disk.st /auto"
Programm alerts messages like that :
1. "use these settings ?" (I sign up with "yes")
2. "Bad sector detected"
or sometimes
2. "Sector not found"

The disk is ok !! It must be the programm itself.
Can anybody help me please ?

>So what's this Gemscript stuff all about? I thought that was some
>sort of freeware/shareware alternative to Scripter. Hmm, this is
>confusing.

GEMScript is a protocol or a blueprint for interprocess communication
and control. The GSCRIPT.HYP says in the Introduction:

GEMScript is a protocol for remote-controlling GEM applications. The
protocol itself has been kept very simple, so that programmers should
have no major problems to support GEMScript in their own programs.

This documentation defines this GEMScript protocol and is therefore
aimed primarily at programmers. Mark well that with GEMScript we are
not yet dealing with a program as such, but only with the definition
of a communication between GEM programs

etc.. I suggest you read it if you are interested as it contains a lot
of info.

GEMScript needs a program to implement it. Scripter is the leading
one AFAIK. Mark Wherry also had one - haven't tried it, but I am told
it's less advanced.

Regards, /Peter/

Source record: 48304

Lyndon Amsdon:

> but how good is it
> for web browsing and FTP'ing (apart from the decrease in bps)?
>
> Stable? CRC/integrity errors?

I tried it out just now, surfing with CAB (2.8) and downloading with Fiffi (1.20), connected via Iconnect on MagiC-PC, there occurred no problems (ISDN).
But I am ashamed to acknowledge that I normally use Windows-programs for my internet-/usenet-activities (I am not yet familiar enough with linux, I hope that I'll understand that OS in my old age).
Javascript is standard and the number of webpages which you can't see with CAB grows daily. And Opera is really faster than CAB!
And there's another weak point: up to now I couldn't find a way to use my ADSL-Account (flatrate) with atari-programs, so I always have to activate ISDN, and that makes 0.029 DM/min additional to the flatrate (49.- DM/month).

Diedrich

4176. New uses for SM-124 monitors?

DynaCadd will convert between the two. I have Rosetta, but it
is pretty buggy. If you email the Cyber file, i'll try to
convert it. EB Modeler will load both formats, is currently
supported, I would give it a try as well.

Hi Mark

>> I almost had a Falc, but couldnt handle one wife even, so i ditched
>>it. Boy did she hate puters, and anything else i was interested in for
>>that matter!!!!!!!

>Thats not a wife thing, its a women thing;-).

Good point..

>They don't understand we NEED

Thats where i was confused, it always told me "It needed"..

>lots of Ataris and fast cars and HIFI VCRs in order for our lives to be
>complete.

Got all them, the car came yesterday. :-)

>All my hobbies are expensive,

Of course!!.

>Guitar,

I would love to play the guitar..

>shooting,

I'd love to shoot the ex!!.

>Star trek,

Ive now got the Trek boxed set and both seven of nine collections. :-)

>electronics.........

Electricity in my veins...

>the missus hates most of it of course.

Of course.

>Get of that bloody computer and talk to me?

WHAT FOR YOU BITCH YOU ONLY TALK ABOUT YOUR POXY MUTHER!!!!!!!!!!

>Whats that about anyway?

I need another bottle, scuse me a minute.

>Mark

>PS the good lady is going to allow me a DVD player

ALLOW YOU!!!!!!!!!!!!, wos-is-about!!!!

>if I get a job,

I just lost one of them. :-) SO i bought a DVD player and a truck load
of disks, must sit down and get through my Trek colection first though,
after ive watched the Green mile again...

>but I really need NVDI 5.

She doesnt /have/ to eat /every/ week does she??!!

Again, thanks all for the feedback!
So, where, how do I get aFTP or GAPftp? Are they packaged with another
program? Are they Mint or Magic only or will they run reliably on a stock
Falcon (TOS 4.04)?
John G.

I think aFTP needs quite a good system, AES 4.1 or better IIRC so
that'll be NAES or Magic etc. GapFTP will run fine. It's made by
Gary Priest so do a search as I'm not sure about the current URL.
GapFTP is more command based, unfortunatly not supporting multiople
file uploads as far as I can see.

> Presuming you have the TT upside down...Beware.

Hi Barry,
For this bit I always just pull the front of the machine forward to overhang the desk and unscrew it blind. In fact, I don't bother doing the screw back up when I close the machine, just for easy access.

I once took my old MSTe to Paul Rossiter because of a HD problem. He flipped it over to undo the screw and the HD bay flew onto the floor with a hefty bump. Strangely, it started working properly after that B^)

>> The ST RAM expansion area is immediately visible beneath the HD

Hi,
you have really good things !!
I love Atari!!
I'm interested on many things!!
But i don't know if I can take all the things !!
I really don't have enough space too!!
An offer Boh ...I really don't know!!
Tell me something !!
I hope to ear from you soon !!
Hi
ROBY

Someone'll correct me if I'm wrong, but I was sure even the basic
Atari board would allow replacement of the 1Mb 30-pin SIMMs with 4Mb
30-pin SIMMs... isn't that right?

4197. Re: PC <- Serial -> Atari

Newsgroup: comp.sys.atari.st
Date: 2001-03-28 23:59:00 UTC
From: Henrik Johannisson <vinco@ebox.tninet.se>
Message-ID: <99ttn9$87u$1@zingo.tninet.se>
Source record: 48324

Thanks everyone who answered !

First, as Lyndon Amsdon pointed out earlier, the serial port driver
is the MFP 68901 and not the ACIA (handles the serial stuff
with the keyboard and MIDI). Ok, seemed to be a long time I
was into this stuff. Anyway, the loopback test seemed to fit me
since I luckily had a RS-232 Wiring Adapter where I easily
can connect exactly how I want. And yes, the serial port worked
perfect on the Atari !!

So now I will investigate what the #"# is going on at other places
so to speak. Thanks to the many replies and suggestions I have
some starting points. So thanks everyone.

And yes, im a big need of a simple serial cable since I have some kind of
"project" which includes transferring all my Atari disks (demos,magazines
and other non-standard disks) to files (typically using the .MSA file
system)
to be able to secure data and making backups (and of course be able
to share the disks in an easy way). So right now my MegaFile40 is loaded!

/Henrik

First thing to do is resolder all the joints on the pcb, failing that check
the capacitors, I have fixed a few psus with this problem. Also had one that
threw a bridge rectifier.

Hi All,

I'm now the proud possesor of an Epson 850C and am in the process of finding those applications that have drivers for it. Good old DA's LayoutTC is no problem, just use the generic Stylus driver, but Calamus is so damned complicated, with it's rastering, at keast to a wrinkly like me , that I can't get acolour print without lines/ artifacts etc. Papyrus gives me a message (in german), that I think, says I haven't enough memory on my C drive, as I deliberately made my C drive smaller than the other partitions, it's difficult to find space. Have any odf you experience with this printer or the like?

Thanks in advance

Bob King

PS, I am still trying to sell my substantially new HP 930c for ï¿½85.

You can get aFTP from the programmers' web site:

http://www.pwp.cz/atack/

It will work with STinG/STiK/IConnect with IFusion/MagiC/plain TOS. You can
pick up a copy of their mailer whilst you're at it.

FamilyNet Newsgate

For those wondering where some of the Atari activity is tonight and Sundays, we have the online Atari chat every Thursday 8 pm Central Standard time at...

http://stargate.cs.swau.edu/atari

And we have a Europe chat session happening 4pm London time (10 am Central Standard time) every Sunday. If you are across the pond, we'd like to hear from you!

Also, if you'd like to sponsor a chat session, I know a place that could use some activity:

http://www.atariusers.com/aunt/

Just go there, click on the "main chat room" option on the left side of the screen and it goes to a auto refresh screen, or you can access...

http://www.atariusers.com/cgi-bin/chat/chatform.html

Just wanted to let a lot of you know that was out there. Take care and I hope to see some of you tonight.

>file uploads as far as I can see.

Both are available on the Belgian ftp-server.

internet/aftp:
total 312
-rw-rw-r-- 1 ftp 157368 Dec 6 1999 aftp155b.lzh
-rw-rw-r-- 1 ftp 143113 Dec 6 1999 aftp155b.zip
-rw-rw-r-- 1 ftp 423 Dec 6 1999 aftp155b_lzh.upl
-rw-rw-r-- 1 ftp 417 Dec 6 1999 aftp155b_zip.upl

Read first the upl to find out which version is suitable for STing/STik.
I believe it's the zip archive.
The use aftp you need indeed at least AES4.1.

internet:
rw-rw-r-- 1 ftp 18723 Aug 27 1999 gftp088.zip

If you're using MiNT or MagiC go for aftp. It's a very nice good working
ftp client.

For the URL of the webpages go to the UTSI pages. You'll find the links
in the Communication/internet section. Oeps I jus noticed that the link
to GAFTP isn't listed. I'll add that link asap. Anyway this is the
address where you can find gaftp

Makedisk will work under Windows 95 and 98 using the DOC prompt. I don't know if it'll work under 98SE but I do know it won't work under WinME. WinME won't allow direct access to the hardware, and you can't boot into DOS without some modifications.

This gets too complicated. Maybe one might copy the layout from MegaST-
if the RP5C15 chip can still be found. It needs address decoding
(a PAL in a Mega ST) and an arrangement for power supply (two transistors
and a diode in a Mega ST). It would be as compatible as a clock can get.
And it works fine in 21st century.

I have never seen Absoft F77, either- just heard of its existence.
I think it was a reputable name, I know they made F77 for Amiga and
at work we have an old industrial MC68K VMEbus computer with Absoft F77,
running on VersaDOS OS (sic).

Prospero F77 is significantly more accurate than BC (though it could
be better), libraries support a memory mapped FPU and makes standard "GST"
type object files. It is supposed to be link-compatible with Pascal and
ANSI C by the same company. It has a quite good source-code debugger. It is
an integrated environment: a workbench with editor, from which compiler
and linker overlays are called, and also a debuger, cross-reference
lister and library program.

There is a standard library and a GEM library for AES & VDI bindings.
"Make" possibilities are limited, unfortunately. Workbench supports
"link" batch files for linking an executable from a number of object modules
and libraries, but there is no provision for batch-compiling a number
of source files. As the compiler overlays are, in fact, executable
programs, it could be possible in theory, but there is no docommentation
on argument passing. Maybe GemScript might help in batch-compiling and
linking. I know Prospero C was made available on a magazine cover disk.
Maybe F77 can be found somewhere, too.

Concerning accuracy: maybe my standards are too high: I am used to
DEC's FORTRAN 77 which, for example, was shown to be more accurate
than any F77 compilers for DOS/Windows. Most of the time Prospero's
accuracy is fine, but it seemed to me it accumulated errors in a very
complex iterative calculation.

>tested the cable with a continuity checker for correct wiring?

That's a good idea I forgot. Did you try the site I suggested? It
took me some time and dedicated research to make an adpator to
convert Falcon LAN to standard serial port but using a combination of
the Falcon manual, schematics (working my way back to the SCC) and
online Mac information I managed it with hardware flow control. Then
it was a job of soldering up the null modem cable which didn't take
too long.

My main problem was that I fitted myself a MFP speeder to make the
port go at 38400 baud and I forgot that this /isn't/ software
controlled. So if I set it at 19200, it'll still go at 38400, whatever
I do. Maybe you should check if you have one? Try running the link
at 38400. You see, I was trying to connect my two machines at 19200
for ages, until I removed this speeder and remembered that the ST is
forced into 38400 mode. I'm stupid. :)

>Is this a drive compatibility issue? The STE has Tos 1.62. Are there issues
>with disks drives in this Tos having trouble reading disks produced by older
>versions of Tos?

The STF is likely to have a single-sided drive, and though the STE should read such disks, it somehow isn't. Possible reason is that the head on one of the drives is out of alignment. If he formats a new disk on the STF, can it be read on that machine? Similarly, can a disk formatted on the STE be read on the STF? The point is that out of alignment heads will read the disks they formatted/wrote but not those with a different track position. The only way to find out which machine is to blame is to try disks written by both machines on a third one. Not 100% foolproof, but if it's a fairly recent machine it should be OK.

Regards, /Peter/

Hello,

I want to connect an Apple MultiScan 14" monitor to an Atari Falcon. I believe the monitor is VGA, but since it is a multiscan, I wondered if it could do ST Low as well.

Can I plug the monitor straight into the Falcon, as the socket seems to be the same size?

Is the Apple MultiScan able to handle ST Low?

If there is anyone using an Apple monitor with a Falcon, and wishes to give me advice, please do!

Thanks

Simon

Hi Joshua,

Concordance Program - latest version that I know of is version 3.00
plus The Holy Bible: King James Version

Concordance Program Copyright 1988, 1989 by
Fifteenth Avenue Bible Church, Seattle WA 98155.
(You could call information for the number - I don't have it handy)

I called them once, because I wanted to see if they had a
New International Version. I never got a response.

You might also try:

Kingdom Age Software
3368 Governor Drive, Suite F-197
San Diego, CA 92122
(619) 586-1082

They had some Bible programs for Atari.

Hello Dr. Seimet,

Mmmm... Then why do directions say,
The controller (link 97) transfers the signals of the ACSI (DMA-)
bus of an Atari ST/STE/TT computer into the signals of a SCSI bus.

Is full featured SCSI bus obtainable only with MEGA STE?
What about MEGA ST4?

> > My SCSI chords are about 3 to 4 feet long.

Hi all. It has been years since I posted here. I still have my Mega ST and use it for basic statistical analysis.

I normally copy the results to a disk - transfer to a PPC and print the graphics and output using graphic converter and Excel.

But I would prefer to move it over my ethernet. Does any one have a plug and play way of doing that?

Terry - w6lmj@arrl.net

4245. Falcon folder problem...

Newsgroup: comp.sys.atari.st
Date: 2001-03-30 05:17:30 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.1010330010928.28762B-100000@halifax.chebucto.ns.ca>
Source record: 48275

Normally when you move a folder frame (with text listing) from one part of the screen to another, just the outline of the folder will move quickly and relocate in the new position. The text listing will then redraw in the new location along with frame. My Falcon is attempting to move the entire listing with all the text and framing intact and thus moves with a jutting motion.

Any suggestions as to a fix?

Thanks...

Source record: 48277

Hi,

Two games I bought from different vendors (both games new and in
original
packaging) do not work.
One of them is 'Tusker' a graphic adventure which hangs after the title
screen.
The other one is 'rock n roll clams', a jump&run which on the ST returns
to the desktop after the intro screen. On the Falcon it resumes loading
after the intro but on disk 2 I get a message about a file named Jy that
is missing.
Did anybody else encounter the same problem or do the games work
elsewhere ?
BTW, I think the problems must be with the disks and not with my
machines
since I tried it on 2 STs and on 2 Falcons.

e-mail: atari@benjamin.net

Lately I've added more Atari inventory and next I'm adding at least a half a dozen boxes of Atari ST Software, including some choice Games. So please checkout my Catalogs Even my 8 Bit Atari Software grew by 25%! And Now I'm offering a 20% Discount to my regular customers! E-Mail me for Details on Redeeming this offer! I'd like to say Thank You for letting Bravo Sierra Computers Support you and your Atari Needs. Haven't bought from Bravo yet? Give Ben a Chance! I can be quite Beneficial. Remember, if you can't call/ E-Mail me today? Call/E-Mail me tomorrow! Call Ben anytime: (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this

message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

You didn't say, but I'll bet that you're running MagiC. You can turn this
effect off with one of the configuration programs for MagiC if you don't
want to explore the bitmap options as per the manual.

Ken Kosut wrote:

> Is full featured SCSI bus obtainable only with MEGA STE?
> What about MEGA ST4?

You cannot get a full-featured SCSI bus with any ST or STE. The only
Atari machines that have full-featured SCSI are TT and Falcon. Any other
Atari machine can definitely not support full featured SCSI.

> But directions (Link 97) say that several meters of SCSI cables can
> be used.

Hmm. My LINK96 directions say it should not be more than 60 cm. Fact is
that long cables have often been a problem in the past.

Hi,

Does anyone know how to get the Epson Stylus
color 680 to print a page from Papyrus? My
former printer (the 500 serie) just collapsed so
I bought a new one. But this one only prints
Calamus files properly but no one from Papyrus.
I allready understood that I have to change
something in the NVDI.INF but don't know what.
All the results I get know are a lot of sign
without anything that even looks nearby the
original page. It is a mess. It is needed in a
bit of a hurry...So if anyone has a solution?

Raoul Teulings

Use Elmar Hilgart's Rom Port Adaptor. I have not got one but people say it
works well.

I believe that there is an NFS program for Mint but for other OSs you will
need to use FTP to transfer the files. (this bit could be wrong, can anyone
confirm?)

Find more info at

http://www.asamnet.de/~hilgarte/ether_e.htm

Mark.

The Kick Off games were a popular soccer game series for the Atari ST and Amiga platforms.
Alongside Sensible Soccer, it is one of the best known soccer games prior to today's 3D games and the EA Sports FIFA franchise.
At http://www.kickoff2.cjb.net/ there is a fan site with a forum which developer Steve Screech regularly enters and discusses Kick Off 3 (working title).

: On 24 Mar 2001 11:43:47 , "Martin \"Nightowl\" Byttebier" wrote:

: >Why don't you use a decent ftp-program for such operations? Newsie never
: >has worked for me.

: Strange, it seems that in some computer configurations Newsie works
: quite properly, while on others it is unusable. Of, course, a really good
: program should not be so picky about the platform it is being run on.
: I use Newsie 0.961 on a MegaST with TOS2.06, and it runs fine (everything
: works: ftp, mail, news), better than any previous version- a lot of bugs
: have been removed, though I notice some- rarely.

On a TT030, running plain TOS, the most decent FTP program I have is
Newsie. The others screw up somehow, usually always, but Newsie gets the
job done. Aftp seems nice enough, but it needs wdialog, as do many things,
but wdialog throws an error, seemingly asking for a handle before there are
any.

That error is OK on plain 3.06, but MiNT crashes, and I am lazy in setting
up SuperBoot.

I got gaFTP, and will look at it. But not everything that runs on a Falcon
or Hades can be made to run on a TT.

Would like to be proved wrong, if it can be done.

FamilyNet Newsgate

Hello Scott!

SC> I have more SM-124 monochrome monitors than STs to
> plug them into. I really like these monitors...

If they're anything like the SM-125 I used to have, they're close to being my favorite monitor of all time. Having worked in CAD systems, I've seen some pretty high-end stuff but it's hard to beat. Pin-sharp, flicker free, I can use them comfortably for ages.

SC> ...and would like to use them on other systems (Mac
> and/or PC clones). Can anyone comment on the
> possibility and/or compatibility issues?

The horizontal scan rate is about the same as a bog-standard VGA monitor. The vertical is better than VGA at something like 70Hz. I have no idea how an SM-124 would respond to 60Hz from a VGA card, and frankly I wouldn't want to try (these monitors /deserve/ an ST! :-) Another possibly significant difference is that VGA's video output is 75 Ohm 'line level', probably < 1Volt. The ST mono monitors probably have a TTL input, and I expect it would be more hassle than it's worth to use them on a PC.

Why not offer them at a special discount price to readers of this newsgroup? ;-)

Regards,
- Andy.

For the sake of those who do not have a Java-enabled browser, the news in question is this:

OfficeSuite will be the TOS platform's answer to Microsoft Office. It features a powerful WYSIWIG (with NVDI) Word Processor supporting TrueType fonts and RTF documents, an Excel compatible SpreadSheet, Paradise Presentations presentation manager and ParadiseBrowser, the platform's FIRST web browser that supports Java 2, HTML 4, secure connections and more. All fully integrated with the same GUI interface and drag and drop capablility. There is currently NO release date, but we expect to be beta testing by the end of Summer 2001.

I am skeptical of such claims.

Hi Steve,

I'm almost sure your correct. I'll do just that. When I try to print the Example.Pap, the one with the watch and the animation frames (JPG's), it starts by saying that it can't load the images due to lack of memory, BEFORE giving me the (NVDI) error message. I guess I have a lack of RAM (only 20Meg, one bank is faulty) as well as too small a C: partition. All this too small this and too small that is very 'Windows'!!!!!!!!!!!!

Bob

You don't say what desktop you are using - a TOS one (which?) or one of
the substitutes. On some desktops you can switch between the two modes.
In jinnee you can do this sesparately for text and icon display in
directory windows.

>Fiffi (1.20), connected via Iconnect on MagiC-PC, there occurred no
>problems (ISDN).
The combination CAB, Fiffi, Emailer & Chatter works great on a humble Atari 68030 based computer as well, you don't really need MagiC-PC or MagiCMac for this, and a 56K modem wont slow it down either...
I've been shouting this for well over three years here.... :-/

>And there's another weak point: up to now I couldn't find a way to
>use my ADSL-Account (flatrate) with atari-programs, so I always have
>to activate ISDN, and that makes 0.029 DM/min additional to the
>flatrate (49.- DM/month).
True... but that's off topic. It would make an interesting thread though.

>Javascript is standard and the number of webpages which you can't see
>with CAB grows daily. And Opera is really faster than CAB!
True again, but we're not comparing Opera, IE or Netscape here... the ASH OVL is every bit as good as the two alternative STiNG OVL's, IMO it's the best of the bunch....While Emailer is doing it's thing, Fiffi downloads some stuff and CAB visits ATOS, Place2Be and magiCOnline, the speed always remains relatively high, thanks to IConnect running in threads.
As an Atari user I don't encounter that many JavaScript pages either... and if I do, I just ignore them, it's their loss.... not mine.

Cheers from Belgium

I have a lot of Atari ST equipment and software that I would like to find a Good Home for. I have used many versions of the ST from the original 520 ST to the Mega ST. The software i have, just about includes every known type from Word Processors to 3D graphics (Cyber collection) as well as numerous games. I do not want to sell these items one at a time, because of the hassle of making many trips to the Post Office. If someone is interested in a Very Large Personal inventory of Atari ST equipment (computers & monitors and other items) and the software please send me an email to the following address for specific details.

>You could find an old external harddisk with a clock on it, I think all
>Supra Drives at 30Mb+ had them - maybe and ICD Link or others may too (I
>don't know).

None of those ICD Link-type host adapters have clocks.

I remember way back when the 520/1040 ST/STes were the norm, I noticed people usually solved this clock problem by adding a hard drive since most SCSI host adapters came with a battery for the clock. However, after ICD's "The Link" was released, it seemed like all the internal host adapters with batteries were discontinued. Sure, "The Link" (and all its cousins) made it easier than ever to add a hard drive to an ST, but that meant going back to resetting the clock everytime you turned it on, or buying a cartridge clock which takes up desk space unless I spend more money for a cart extender.

>I thought about that (but using the MegaSTE as the example) but the
>parts are too difficult to find. Easier to find an FMC or similar.

An FMC is easier to find? Where? Since it seems like the internal way is a lost cause, I'll spring for the cartridge clock if someone can point me to a place that has FMC IIs for sale at a reasonable price. (I definitely need the cart pass-thru)

Thanks, Phil

It's more a setup fault. Launch Papyrus and go to the Options menu.
Choose there options/memory. Here you can change the memory that Papyrus
takes for itself, I believe by default 8 MB. Here you can also play
around with speedo cache and print cache etc..

It's not Falcon specific. I remeber using it on the STE. It's got no
fancy GUI and it's not a complex program. Does the job very well,
good for more basic systems and should run fine under Mint.

Not much to see there. They states that they are working on a new browser for Atari, called Paradisebrowser, capable to use Java 2, HTML 4, secure connections and more. They also says that there is currently NO release date, but they expect to be beta testing by the end of summer 2001.

Frankly I don't believe a word of it.

ps. if you want to see it yourself go to http://www.paradisewebdesign.net/paradise/projects.htm (tested with Cab 2.80)

You must use the latest Mac Runningtime Java (MRJ)

> But I would prefer to move it over my ethernet. Does any one have a plug
> and play way of doing that?

Atari ST... well there are a few things you can use. But it's a pitty almost none of them is still available.
1/ Genius LAN adaptor (with ROM port adaptor cfr Elmar Hilgart) => not available anymore
2/ Rieble Card Mega ST Bus => not available anymore

some other parallel port ethernet adaptors who aren't available anymore.

If you can do some soldering yourself, I propose you make a ACSI-ISA interface and connect a ISA NE2000 compatible card to it. STiNG drivers are available.

A couple of links are available here :
http://gallery.uunet.be/saka/atari/ethernet/index.htm
+---> ACSI - ISA :
http://home.nexgo.de/thomas.redelberger/prj/atari/ethernea/

If you have other questions, feel free to contact me.

I'm always glad to hear of an Atari being put to good use!
:-)

TRR> I normally copy the results to a disk - transfer to
> a PPC and print the graphics and output using graphic
> converter and Excel.

Is your PPC machine a PowerMac? If it's one of the older beige Macs, and if you have a free serial port, it may be easier (and less expensive) to use a serial 'null-modem' cable to transfer the files. How large are they? If your Mac is newer and lacks a serial port, it should be possible to add one via USB. If your PPC machine isn't a Mac, check its user guide for information about serial ports.

Yep I've got one...

>but Calamus is so damned complicated, with it's rastering, at keast to a
>wrinkly like me , that I can't get acolour print without lines/ artifacts
>etc.
The trick is to find some good combinations, forget all about the HP settings since an Epson needs completely different values. I've mailed you my settings (CRI, CK4 and CK7) which hopefully improve things a little....

>Papyrus gives me a message (in german), that I think, says I haven't
>enough memory on my C drive, as I deliberately made my C drive smaller
>than the other partitions,
Edit the NVDI.INF file and tell it to make a spooler file somewhere else.
SPOOLPATH = C:\GEMSYS\SPOOL\ (it doesn't need to be in a folder)...

You should make sure that at least 100MB is free, an A4 in true colour eats memory...

Cheers from Belgium
Dennis

Hi Lyndon,

>Thats about ï¿½30, not too bad I guess. The good thing would be the way
>it intergrates with Scripter and Magic.
Indeed, all the IConnect clients are GemScript clients and can interact with each other, it's these features which IMO make them stand out compared to STiNG/MintNeT clients. One should regard the seperate clients as a suit, since once installed that's the way they work...

>Is it possible to do two things at one time, I know CAB can't download off a
>website and carry on browsing another site,
I usally download from two or three sites at once...

>but how good is it for web browsing and FTP'ing (apart from the decrease in
>bps)?
If IConnect has been set up correctly, you'll hardly notice a drop in bps, in normal conditions I access ATOS with CAB at 6000cps, while Fiffi is pulling in files from a fast ftp server at 5000cps, when Emailer is busy with exchanging postings the overall speed will drop with 650cps. Chatter doesn't influence the bps at all....

>Stable? CRC/integrity errors?
The CAB OVL is every bit as good as the STiNG OVL's, I've never known Emailer to drop a connection, and FIffi is rock solid. Can't really comment on Chatter since I hardly use this...

>Thats about ï¿½30, not too bad I guess.
Assuming you use a commercial version of CAB, then reinstall it. All versions of CAB come supplied with IConnect. Fiffi is included in CAB as well, so this only leaves Emailer....

Cheers from Belgium

You need Java -- not JavaScript -- to access the specific page from the
URL above. The frame on the left contains an applet to navigate the
site's various pages, which then open in the main frame.

But the page in question can be viewed directly (without Java) at:

There's a Netscape plug-in to allow use of MRJ (Mac OS Runtime for
Java), but this doesn't matter since it requires a PPC. Because Hallvard
runs a 68K Mac, he won't be able to use MRJ in any way.

Netscape last supported Java on a 68K Mac in v3.04, which I suspect
would be inadequate today (the Java implementation, not the browser).

Body handling: HTML body converted to readable text

FamilyNet Newsgate

Hello Hallvard!

HT> .....looking at the HTML source code I see that it's
> been made with microcrap backpage using CSS and all
> sorts of rubbish. No wonder it won't work!

This is probably nit-picking but CSS is, in principal, a good thing. It enables people to separate presentation from content when developing a web site, and is an important step towards undoing the horrible pollution of HTML (" tag considered harmful...") that has resulted largely from web authoring tools like MS FrontPage, written by people who evidently don't understand the Web.

I use CSS on most of the sites I work on these days, but always in a way that is backward compatible with older browsers. I test them with an old version of Mosaic to verify that although the presentation isn't quite as polished without CSS, no information is lost.

A trivial example: On my (very spartan) personal site, I use CSS to render as black text on a yellow background (as though it had a highlighter pen run over it). An older CSS unaware browser won't do that, but should still emphasise the text in question.

HT> (hmmm.... it won't work here even if I turn on CSS in
> my browser!)

If it was produced in FrontPage as you imply, there's probably much worse stuff going on than use of CSS.

I would welcome feedback from users of CAB (or other Atari browsers) regarding my personal site, as I would like all the sites I work on to be accessible to Atari users.

Unfortunately there is none...

> So far upon loading it exits straight away.

Well, the latest version will actually work pretty well, if you enable the "direct screen"-option. However, the mouse-cursor may stop moving in this case. Apparently there is a timing-problem with the Eclipse that might lead to missed writes if you have a fast CPU (Afterburner or similar), and optimized software like Aniplayer suffers the most.

If you disable "direct screen" things will improve, but the colours will be all wrong (atleast in 16 bit mode) since the physical pixel-layout (which Aniplayer use when building the device-dependant bitmap later blitted to the framebuffer using the VDI) differs from the device-dependant layout. Hmm, I was supposed to report this behaviour to Johan but I believe I've forgotten it... Johan, if you read this, can you contact's the author of Aniplayer? He's aware of the problem.

Do you use MagiC? I had the exact same problem when I used MagiC on my
Falcon, it required a soft reset before the DSP could be used.

Actually, there is, if you're using a 030-Falcon. Use "direct screen" and
enable "xbiosfix" in fvdi.sys, the latest version of Aniplayer will work
fine with this.

Hi Dennis,

100MB free spool, ye spirits we're talking big time here :)) But an
A4 in TC doesn't know and doesn't care a TOS (get'it!!) whether it's

talking to a humble Falcon/Milan or a Pentium IV.
I've already switched the spool to my F: partition, but can't find 100MB. What with more RAM, the DM80 for the SCSI driver, this Milan is getting to be a costly baby!!!

All the best from Wales, the land of the burning cattle and sheep pyres and all started by a Mandella Biltong sandwich at the Labour Party Conf?????

Bob.

Hi again Dennis,

the CMY cartrige died soon after arriving and then two days afterwards the black followed. Out of curiosity (I was a cat in a prior incarnation) I took the cartridge apart. It's 99% sponge!!!!!!!. I managed 2 tablespoons of water before it saturated!!!! And for that they charge £25!!!!!!!! At least with an HP cartridge you get a whole lot more ink and a printed circuit thrown in. What a way for Epson to make money, and hey ho for refills!!!

Bob

OK, John got back to me and stated he's no longer involved with FlashII
and (basically) it's in the limbo commercialware catagory! So until it's
status is officially changed I won't be passing it around!
However, if anybody knows where to get a demo version that would work.

Where does one have a look? Seems like a nice excuse to sacrifice some VGA board EPROMs.

>I think a decent emulator is needed. One to toy with. Spare parts are
>becomming rare. I heve to get a fully functional alternative before I run
>out of spareparts.

I have got five STs, and refused to buy a sixth (probably at an 8 EUR price) only this week. With the ridiculous amounts of superfluous STs around, surely spare parts can't be a concern?

How? When I download something from CAB (not via ftp) and click the
home button to get back to my search engine, it says "connection has
been aborted" I end up at my search engine page with a corrupted
download as it shut off halfwy through.

>>but how good is it for web browsing and FTP'ing (apart from the decrease in

Hmm, I wonder if Iconnect can get a faster cps than Sting or Stik.
The max I've seen is 4000cps. Maybe it's something to do with having
bad phone line living in a village.

>>Thats about £30, not too bad I guess.

No, CAB 2.8 was one piece of software I didn't get from Atari
Workshop. I'd rather palce 30 pounds on a piece of software that is
actually being developed and enhanced. The money will be going
nohere.

|
| If they're anything like the SM-125 I used to have, they're
| close to being my favorite monitor of all time. Having
| worked in CAD systems, I've seen some pretty high-end stuff
| but it's hard to beat. Pin-sharp, flicker free, I can use
| them comfortably for ages.

The 125 was, I think, very similar to the 124 but with a swivel base
(and maybe one or two other changes). The display was certainly
ahead of its time but nowhere near as good as the TT High res with
an Eizo large screen monitor.

That's normal I should say. Try once a right mouse click on the link.
Normally this should provoked background downloading. Nice and very
usefull. You can have as many as background downloading as you like.

Andy, thanks for the information. I am on 14.325 Mhz in the MicroComputer Net. It started as an Atari net - but now has users of a wide variety of computer platforms.

I may try the null modem through the serial port - but I am not really looking for a file transfer, as much as I am interested in a network share drives and the Internet procedure.

I have TCP/IP ethernet and service NT, PC, and Macs on the same network all with access to the Internet through the TCP/IP network.

I was hoping for a way to add the Atari to the ethernet.

Good to hear from you. May be you can join us Sunday at 1600 UTC on 14.325 MHz from time to time.

No, I'm using vanilla-TOS. My original Falcon did have that problem
too, that using one program dodn't seem to reset the DSP properly and
subsequent programs would only work after a reboot. But my 'new'
Falcon's DSP (motherboard replaced after a lightning strike) doesn't
seem to work at all, or maybe flakily.

Futher info - as shown in my copy of FVDI.SYS that I posted, GT Look
II also seems to require xbiosfix, howere Newsie then can't extract
files from emails! Peculiar, but that seems to be what happens. So I
only enable xbiosfix when I need to use GT Look II.

If you are not interested in getting debug output (and other text output)
on the normal Atari screen, keeping 'xbiosfix' and 'lineafix' active
at all times might be a good idea. Neither should be necessary for
proper GEM programs to run, but...
Some programs might be unhappy with one or the other switch, but they
are not common (The latest version of fVDI can work together with the
latest ACC to modify some parameters on the fly. 'xbiosfix'/'lineafix'
are not currently among them, but I expect them to be shortly.)

'xbiosfix' patches the XBIOS to make physbase() and logbase() return
the RageII frame buffer address, and getrez() to return 7.
There should never be a reason to call the latter, and the first two
are only of use for programs that access the screen directly.
There is no other way of getting at the address of the screen, but that
isn't a terribly good idea in the first case.

When running without the PCI BIOS, direct screen accesses on the
Eclipse/RageII are not possible at all (the PCI memory space is banked
to fit into the available memory map (unlike the NOVAs, which take over
space usually occupied by Falcon RAM expansion above 4 Mbyte)).

With the PCI BIOS, bus errors are caught by a handler which then maps
the appropriate PCI memory areas into the 68k address space. On an '030
this should always work fine, although things can obviously get horribly
slow if accesses jump around the screen (for example when copying from
one location to another). On an '040, certain kinds of accesses (such as
trying to move to/from a long word spanning two banks) will cause an
infinite loop of bus errors...

As long as only word accesses are done (which isn't much of a limitation
since the Falcon bus is only 16 bit wide, anyway), things should work
fine even on an '040 (as long as the PCI BIOS is active).
Except when pixels are generated on the fly (not buffered in normal RAM),
using the VDI should have negligable performance impact or even be

faster, however.

As Jo Even mentioned, there seems to be some kind of timing problem
which causes trouble directly after a bank switch on a fast CPU (at
least noone has reported similar problems on an '030).
The most common place in the VDI where such bank switching is done is in
the mouse movement routines. An interaction with an internal 'semaphore'
can then cause the mouse routines to behave as if there is a drawing
operation in progress and discontinue the mouse updating.
The same kind of problem can occur when blitting from the screen to
normal RAM (another reason for having 'imgcache' and 'aescache' active ;-)
or when a program does direct screen accesses.

The only place where I've been able to reproduce the timing problem
consistently has been 'fixed', but the problem is not gone. It ought
to be possible to implement a better fix inside the bus error handler,
and I'll get to that.

Once again I'm left wishing I had a radio. :-/

W6LMJ> I may try the null modem through the serial port -
> but I am not really looking for a file transfer, as
> much as I am interested in a network share drives
> and the Internet procedure.

It's possible to run Internet protocols over a serial cable. That is slower than Ethernet, but adequate for some applications and almost certainly less expensive for an Atari.

TRR> I have TCP/IP ethernet and service NT, PC, and Macs
> on the same network all with access to the Internet
> through the TCP/IP network.

I work with some basically similar networks (sans NT). I've never used an ST with Ethernet though. I have seen an interesting site by an Atari enthusiast who hoped to encourage a developer to write drivers for the SCSI -> Ethernet network adaptors that were used with some older Macs. It doesn't seem to have been updated for some time though, so perhaps the project has been abandoned.

Older Ataris can be networked together via their MIDI ports, and newer ones presumably via their LAN (probably RS-485) ports. A spare TT (or perhaps even a MegaSTE) with a VME Ethernet card might be able to act as a bridge between Ethernet and the other Ataris. Not directly relevent to your situation I know, but a possiblity that interests me (anyone here done this?)

W6LMJ> Good to hear from you.

Likewise!

W6LMJ> May be you can join us Sunday at 1600 UTC on 14.325

Hello Dr. Seimet

I rewired my system with shorter SCSI cords.
(as you suggested)

Booted with better results. But still not right.

Setup:

SCSI Hard drive Set to ID 0
CD-ROM Set to ID 1
Floppy Optical Set to ID 2
Syquest Removeable Set to ID 3 (Terminator on Syquest)

DMA OUT of Link 97 --> IN of SLM804 Controller.
OUT of SLM 804 Controller --> IN of SH204.

Problem:

> From my understanding, the Link converts the ATARI DMA signal to SCSI.
> I don't understand why it says BUS 0 ACSI 0 (ID check)
> ACSI 1
> ACSI 2
> ACSI 3
>
> Shouldn't it say SCSI
> As that is what the signal is being converted to?
> ========

Ok, so the STE does not have full feature SCSI BUS.
I assumed it did, so I did not change the dip switches in the
SH204.
Thinking that all SCSI devices would be separate from ASCI devices,
my SH204 dip swithces are set to Unit Adress 0.
Thus conflicting with my SCSI device (set to ID 0)
upon bootup. (I think)

So if the Terminator is on the Syquest (ID 3),
should I set the dip swithes on the SH204 to Unit address 3,
and move the Syquest to ID 4?

thank you for your help.

ken

I have used a Win-95 pc as gateway for my Ataris with tcp/ip through COM2
- nullmodem - Atari. This setup will work with any ST, TT, Falcon. The
problem to make the pc use COM2 as part of a LAN was solved with NAT32
from http://www.nat32.com/ . This setup worked quite nice and the pc
could still be used for normal tasks too.

Fortunately I was able to get one of the Ethernet-ROMport adaptors so now
I'm using that instead.

As long as only the last drives in a SCSI chain are terminated and there
are no duplicate IDs everything is fine with your choice of IDs.
Note that regardless of the fact that the ST/STE does not have a real
SCSI bus the IDs for any device have to be unique. It is not correct,
for example, that a Megafile drive has the same ID as a SCSI drive on
the same bus. And you must not use ID 7, as with the LINK96/97 this is
the ID of the LINK.

I have also found that some devices do not terminate very well (with their
built in termination), you could try terminating with a different device or
a proper terminator block.

Mark.

Can you give more details on the devices where it didn't work for you?
Usually I always use external terminators, which ensures that you can
always add another device to the chain without having to fiddle with
jumpers or resistor packs and without having to open the case.

4359. weird Superbase problem

Newsgroup: comp.sys.atari.st
Date: 2001-04-02 13:55:38 UTC
From: pjsmith@netins.net
Message-ID: <slrn9ch16q.igv.pjsmith@worf.netins.net>
Source record: 48191

I'm attempting to run Superbase Professional on a 4 meg Atari 1040ST with TOS 1.04 and I'm experiencing something really weird. Every time I open the program editor, it acts like the '-' key is stuck and starts printing dashes continuously across the screen. This is the only program I have that does this so I don't think its a problem with my keyboard.

Anyone have ideas/solutions to this problem?

Thanks!

Phil Smith

4362. Mega DI Images are done

Newsgroup: comp.sys.atari.st
Date: 2001-04-02 16:04:35 UTC
From: ebaiz@skyenet.net
Message-ID: <nq1y6.26$f35.282@newsfeed.slurp.net>
Source record: 48193

Hello All,

The Mega DI Images are done. There are 22 of them and they hold 800+
8-bit games. There are some real nice titles like BallBlazer, Archon I
and II, ChoppLifter, Pacman, Necromencer, Fort Apocolypse, One on One
and more. These images work with an 800 XL or 130 XE computer. I did
not try it out with my 400 computer yet, so I am not sure about it. You
also need a SIO2ST(PC) cable which is the same one that works with APE.
Then you need an Atari 16-bit or greater computer. And finally 800XLDJ.
The games work great and I really love it since now I can store these
on my hard drive and not have o work about the disks.

I will be uploading them to Aaron Wheeler who will be putting them on
the site below:

http://homepages.paradise.net.nz/atari/This process with take a couple of weeks. if there are any questions or
comments, please email me or post them here....

Hi Jos,

JV>I have a MegaSTE with a Spektrum TC1 graphic card (Wilhelm
JV>Mickroeletronik).
maybe I've got the same. True Color with 1 MB video RAM.

JV>I tried ET4000 , didn't work.
Mine is an ET-4000, and it works with NVDI.

You need NVDI.PRG and NVDIVGA.INF in the AUTO folder and the whole
NVDI stuff anywhere.

NVDIVGA.INF may be prepared by VMG4000 (video mode generator for ET-
4000) that comes with NVDI. But be careful not to install modes your
monitor can't bear!!!

And do not mix up the original Wilhelm drivers and NVDI! Either
original or NVDI!

If I'm able to help you, I'll do so, but I don't know if there's any
major difference between your STE an my TT. I hope there's none. At
least concerning this point.

Und TTschï¿½

Have you tried playing with Iphigeny? Useful tool as you can "see"
the connections being made and a simple LOD file will help to see if
it works. Runs under TOS as ACC I think. I'm sorry to hear about the
Flacon mobo, where did you get a replacement too?

Whaatt? Voyager is brill. Same principal as TOS. A ship out where no man has
gone before. Incedently they are home now. Filming is done. There is a new
series coming out, it is supposidly NCC-1701-F, uss enterprise, in the 25th
century.

Was the TTM-195 made by Eizo? I kind of have my eye out for a 1152x864 monochrome monitor for some SUN equipment. At 80 DPI that works out at 18" visible diagonal. At 96 DPI it is 15". Of course, I'll have to figure out how to tell X what resolution it's running at! :o) I may have asked this already, but what is the actual picture size of the TTM-195? 16 2/3"?

This is a very interesting piece of kit. There is a similar program on the Mac side of the house, IPNetRouter, that serves as a robust router, firewall, among other things.

Here is some of the information from its website:

IPNetRouter Overview

IPNetRouter is the simple low cost way to share your cable modem, xDSL, or dial-up internet connection with your entire LAN. With IPNetRouter, you can use multiple IP interfaces at the same time (such as Ethernet and OT/PPP for example), and specify additional routes for communicating with more than one IP gateway.

IPNetRouter is a complete IP router and firewall solution including a built-in DHCP Server, NAT with inbound port mapping, and IP filtering to setup your own firewall. Other features include support for PPPoE and Quicktime streaming. IPNetRouter's OT native design offers superior performance easily outperforming other low cost hardware and software solutions.

System Requirements

* MacOS 7.5.3 and Open Transport 1.1.1 or later (OT 1.1.2 for 68k)
* Macintosh PowerPC or 68030 or higher.
* A Macintosh capable of connecting to the Internet using the TCP/IP protocol suite.

The website is http://www.sustworks.com.

The question now is whether the IPNR can route TCP/IP through the serial port? My guess is it can - I just never thought to try it.

I also have a ASIP server on the network that implements SAMBA allowing all my windows PCs to share file space. I wonder if it will also allow the Mega STe to do the same thing. My guess is it will, as long as I grant access to "guest" computers.

Thanks for all the responses.

I have written a rather long text on the subject and I am right now
working on the screenshots and on my new webpages in general. Should not
take very long at all now as I have some spare time at the moment.

I'll be back! In the meantime you might take the opportunity to read up
on proper quoting techniques. Those who replies above the original text,
quoting everything, really leave a lazy impression on me. Maybe that's
the reason they need help in the first place?

They do mention ppp so maybe? NAT32 has a built in _dial in server_. If
you have a permanent connection on the pc you can use a standard modem
and have a sort of "isp of your own". That's the reason they have support
for COM2 built in. Luckilly it could also be used with only a nullmodem
cable.

On the other hand as Macs nowadays lacks serial ports the chanses are
less compared to pcs?

You will be able to use ftp between the Atari and other computers. "File
share" can mean a lot of things and they all need some sort of
client/protocol on the Atari side...

Hi All,

following a plug a while back on this NG, I joined UKFantastic. It was easy joining using my works PC and logical how to write my Sting and Dialer CFG and SCR. It's a faster connection than zetnet, though I'll run the two in tandem for now. However for a 'new' company, plugging itself as the way to go, it's a bit disconcerting to find their main UKF Extras page at:

www.ukf.co.uk

talking about the 'millenium bug' and 'the turn of the century only a few months away'. Hadn't some one have a quiet word in their shell likes about public image!!

It cannot. Though it is multisync, it most probably won't sync below 31 KHz.

IIRC, there are STiNG drivers for the Riebl as well.

Anyway, there are solutions for every OS and Atari, but if you've got a Mega bus slot, you'd do better putting that to use.

Oh for the early days of computing. The first disk drive I bought (floppy not hard) stored a whopping 80K (40 x 2K tracks). Disregarding inflation it cost 4x what the 20 Gig did. My jottings have got no bigger and Atari files aren't as bloated as some systems. What the heck could I do with a terabyte?
Brag perhaps in my sig ;-)

I think your problem may lie the last 2 lines. Shouldn't the SLM804 be
on the ACSI bus? In which case the Link 97 should be on the OUT port and
not between the computer and printer.

Thanks Martin,
But therein lies the problem! I can access your files but Newsie
is downloading the same file multiple times which means the larger the
file, the longer the download time! Still trying to track down why!
Hence the need to try another FTP prg.

You really do live up to your reputation. Where you the
type of person at school to have a strange hairstyle and
get expelled ? Did you ever leave the playground and
join a civilised society ?

Your only response to my polite posting was to try and
be abusive to me. Better people than you have tried and
failed to annoy me. For your information i am not on
tablets (as i am 'HAPPY') but you probably will be if
you carry on the way you are.

Just for your information I am not new to this group and
have been an active participant for about 3 years, I have
posted under an alias as I for one am getting fed up of
your abuse and other regular members agreed with me.

I am well aware of the regular posters to the group. I must
admit at first it was slightly funny to read some of your milder
abuse years ago but I and other members are fed up with
your constant lack of regard for other descent members.

Please either curb your abusive postings, or leave the group.
You are by far the worst abuser and people are fed up with
reading your drivel. I understand that you have too much time
on your hands at the moment but get a life - it really does have
a lot to offer.

HAPPY.

Hi Lyndon,

No accusation intended, I just used 'plugging' out the top of my empty head. They seem to be as good as any other, and theye are free. As for the quality of the phone line, my connection to the high speed V90 line at Zetnet can get very noisy, and more often than not lately, I've been thrown out. It seems to be some thing of a random chance as to what line I get. Could be due to me being up a welsh mountain with overhead lines etc. I have only experimented with UKFantastic, I was very pleased to find it so simple to log on with Sting. But I can't be bothered to change all my INF and CFG files for aMail and Newsie to make it my permanent ISP. That may change however, as Zetnet were grumbling that BT wouldn't give them the use of the free 0800 line since BT said they were not 'a premium (or quality) server). If UKFantastic can get the use of the free BT service, then I will change.

Bob King.

Maybe because (s)he needs something to complain about? As for people
being fed up with his 'drivel', if they don't want to read what Steve
says, they can either use a killfile or just don't click on messages
that are sent by him.

>100MB. What with more RAM, the DM80 for the SCSI driver, this Milan
>is getting to be a costly baby!!!
100Mb is the maximum, it might fit in 75MB...
NVDI is page oriented, unlike i.e Calamus or ImageCopy which build up the
image line by line. Just place a little thumbnail in a corner of the page
and see NVDI go berzerk over it... before the page is finally processed
and printed a line oriented printer driver will have printed ten of those
pages...

Cheers from Belgium

Hi Bob,

>the CMY cartrige died soon after arriving and then two days
>afterwards the black followed. Out of curiosity (I was a cat in a
>prior incarnation) I took the cartridge apart. It's 99%
>sponge!!!!!!!. I managed 2 tablespoons of water before it
>saturated!!!! And for that they charge ï¿½25!!!!!!!!
The black cartridge holds 30ml and the CMY cartridge 15ml of each colour,
that's a lot more then 2 tablespoons, unless ofcourse you're using *very*
large spoons ;-)

>At least with an HP cartridge you get a whole lot more ink and a printed
>circuit thrown in.
The black cartridge on average is good for 800 pages, the CMY cartridge
can handle up to 100 pages of A4 photographs and/or 550 pages of coloured
text. AFAIK these figures are comparable with HP and Canon printers.

>What a way for Epson to make money, and hey ho for refills!!!
All printer manufacturers earn a fortune selling these cartridges, I buy
the ink for the Epson in bulk from a German supplier.
A bottle containing one litre costs roughly 30 Pounds, which is less then
one Pound for a refilled cartridge...
http://www.ren.de , they accept credit cards and are very reliable...

Cheers from Belgium

Hi Lyndon,

>Hmm, I wonder if Iconnect can get a faster cps than Sting or Stik.
>The max I've seen is 4000cps. Maybe it's something to do with having
>bad phone line living in a village.
IMO yes... but the quality of the phone line and your ISP will influence
it a little ofcourse. I usally connect to my ISP at 46600 or 48000bps,
don't underestimate the ISP, the one I'm using now (Versatel) is the
fastest I've ever encountered, between Versatel and Wanadoo (my previous
one) there's at least a difference of 25% in speed...
You should always inform how much minimum bandwidth the ISP guarantees,
if it is lower than 10.000bps, forget all about it and start looking for
a better (faster) one...

>No, CAB 2.8 was one piece of software I didn't get from Atari
>Workshop. I'd rather palce 30 pounds on a piece of software that is
>actually being developed and enhanced. The money will be going
>nohere.
IConnect is supplied with CAB since version 2.3, Fiffi is supplied since
version 2.7...
I wasn't even aware that Atari Workshop sells CAB 2.8... :-/

Hi John

As a temporary solution, you could install CAB-FTP MODULE. It isn't a full blown FTP prog, but if you write the exact address in CAB, you can use it to download from ftp archives. I could mail it to you, if you would like to give it a try (about 60k IIRC).

Hi Dr. Seimet,

ID 0 (SCSI device)
ID 1 (SCSI device)
ID 2 (SCSI device)
ID 3 (SCSI device - terminated with block terminator)

ID 4 (DMA device - SH204 dip switches set to unit address 4)

New Problem:

SLMC804 Controller has dip switches.
Factory set to Unit Address 7.
If Link 97 intern occupies 7,
SLMC804 Controller dip switches must be changed to Unit Address 6.

==========
Summary:

ID 0 (SCSI)
ID 1 (SCSI)
ID 2 (SCSI
ID 3 (SCSI - terminator block)
ID 4 (DMA - SH204)
ID 5 _
ID 6 (DMA - SLMC804 Controller)
ID 7 Link 97 intern
==========
correct?

thank you.

ken

Hello,

I may be misunderstanding:
The Link 97 intern is a ciruit board with 3 connectors.
DMA IN DMA OUT - these are external.
SCSI connector is Internal.

So the Link 97 has a DMA OUT (or ACSI).
I am trying to use this port so that I do not have to run the
laser everytime I use the computer.

thanks for your email.

Source record: 48054

It seems I had a program called Winx running at startup. Disabling it allows my folders to move quickly as outlines. I don't know what Winx does because the instructions are in German but I was able to understand a couple of words, one of which was 'redraw' and presumed it was telling my system to redraw the folders constantly while they were moving.

Thanks to all for the suggestions.

PS- By the way, LetEmFly is a confusing program which is basically a line of buttons on a bar for STinG and CAB in the upper right corner of the screen. If this is not the program then there is a mistake as such on the ftp site as this is what I downloaded and opened.

Yep. TT #1 has a Riebl, #2 is connected to it using PLIP.

As I already mentioned, everything is OK as long as there is no duplicat
SCSI ID, the cables are not too long, and as long as only the last
devices in the chain are terminated.

OK, Now a "Networking" article covering the subject how to get an Atari
without Ethernet on a DSL connection by help of a pc running NAT32 is
online at:

http://atari.mine.nu/

I have also put up a picture showing my equipment. I will be out now
until 8 pm GMT tonight so hopefully the server is still online when I get
home. Actually it has proven to be very stable, the TT running the server
has put up bombs on the screen only once and the reason was severe memory
fragmentation within STinG.

>laser everytime I use the computer.

I haven't joined this thread before because I've no experience of the setup that you're describing. But if all this is only because you want to be able to use the computer without having to switch the laser on, then I'm afraid that no amount of fiddling with the plugging or IDs will help.

Instead, you must investigate ways of powering the controller seperately, so that the laser can be left switched off. Open the controller and snip all the pins to the PCB from the large connector which leads to the laser that carry the 5V supply from it to the controller, and connect a *regulated* 5V "wall wart" supply across the nearby electrolytic capacitor observing polarity.

I've described this and a similar, less invasive, method in the group before.

All at your own risk.

Hi all,

I've just spent some time tidying up the resource files for jinnee 2.05, the English version of which is available from

http://www.atari-workshop.co.uk

The package also includes fully translated Scripter scripts (handy if you want to see how to program your own plugins), and a corrected ext-conv.cfg for the lengthen/shorten extenders plugins.

Hi Jorgen (how did you get those dots over the "o"? Swedish keyboard?),
I have CAB-FTP but couldn't figure how to get it to work! I tried it in
the folder and as a separate program (APP) but it did'nt run. Maybe it's
for Mint or Magic. Running a stock MKI (14 meg) TOS 4.04 Falcon here.
John G.
P.S. Got aFTP from Chapelie (Newsie let the file download only once)
and it works well! No repeats! Now I'm concerned with speed (cps).
For another thread.

No it's not for multitasking, should work alright in straight TOS.
One selects it under "Internetclients" IIRC, then it should be
working.

The Belgian ftp server can be accessed by Cab. Just use
ftp://chapelie.rma.ac.be/atari as address.
It's possible however that you have to use a proxyserver. At least that
is what I must do if I want to get to the server.

Sting users must use a syntax like this in the proxy settings:

For HHTP proxy.pandora.be:8080
For FTP proxy.pandora.be:8080

MiNT-net users who use the MiNT-net.ovl must use this:
For HTTP http://proxy.pandora.be:8080
For FTP http://proxy.pandora.be:8080

Needless to say ofcourse that the above is just an example taken from my
setup. You'll have to edit the proxy server name to suits your setup.

HTH,
Martin

If you follow Steve's threads that closely then you know
that Steve and I have had our share of disagreements.
We got past that. So what if Steve is a little rough around
the edges, or you dislike his humor. Telling someone what
to do or how to act won't work, never does. If you have time to
complain you have time to set filters or skip his posts.
If you can't do those things you might consider getting
newer software as well.

Take a look here if you want to see what drivers are available for what
ethernet solution...
http://gallery.uunet.be/saka/atari/ethernet/commoneth.htm
Mint drivers are realy rare to find... just like STiNG drivers... but the
Rieble card has both of them, together with some other drivers...

Nothing special, I have had problems with a couple of devices when using
their inbuilt termination, this could simply be a bad dip switch, etc.

I have had devices in the middle of a chain being repeated after the end of
a chain for every spare ID, giving the impression there is something wrong
with this devices, using a proper block resolves the problem.

Mark.

Hi Dennis,

Yes, wellll perhaps I exagerated a little :)) I have got some replacement cartridges from Cartex at:

www.cartex.co.uk

for £11.74 the pair.

when these go, it'll be ink refills. The cost of their CD cut out papers and glossy paper is also very good. No doubt the germans do them cheaper, but it's the import cost!!!!!!!!

Still wondering at your knowledge, and waiting for your Calamus files :))

Bob

Sure. It has been shipping for qutie a while now, I got mine last June.

> Pictures? Results? Opinions?

Installation is very easy, just plug it in. Works perfectly with my
Afterburner, so it should work with any accelerator that actually allows
additional expansion-cards.

fVDI and the Eclipse driver has evolved a lot the last year, I ditched
NVDI a few months ago since I don't have a printer and can live with just
bitmap-fonts. In fact, fVDI/Eclipse is extremely fast at this, text-output
is incredibly fast compared to any other VDI I've seen. This also applies
to blitting and most (if not all) VDI primitives. Here's the GEMBench
results on my Afterburner:

```
GEM Bench v4.03 ï¿½ Ofir Gal - 3 March 95

4445. Converting MIDIfiles between formats - help please

Newsgroup: comp.sys.atari.st
Date: 2001-04-04 19:44:24 UTC
From: sonik@wearelondon.fsnet.co.uk
Message-ID: <9aftio$d8m$1@newsg2.svr.pol.co.uk>
Source record: 48077

Hi folks

Can anyone here help me out with a music-related problem I've come across recently? My main sequencer is Passport's rather excellent Master Tracks Pro 3.6 which can read and write MIDIfiles in either format. I'm running a single TOS 1.62 STE 2 meg.

I've a few Format 0 (all on one track)es I'd like to convert to Format 1 (all parts exploded) and have used MIDI Music Maker 2.26 in the past to get this done with no problems. However, I have just tried to convert some Format 0s and when I load the new (supposedly Format 1) file into MT Pro to do some work on it, it chews it over for a while and then crashes!

Admittedly I don't use MMM very often and may've forgotten something important along the way, but if anyone here has also come across this and knows a solution or even another program which converts between MIDIfile formats, please get in touch.

Cheers for any help and may the Fuji always be with you!

Al :)
sonik@wearelondon.fsnet.co.uk

ps I've tried loading a Format 0 into MTPro and then saving it as Format 1 but this doesn't seem to work either...

| . . . .
| Was the TTM-195 made by Eizo?

Don't know. The Eizo Flexscan 6500 (21 inch screen) works in ECL mode for TT High - on the Hades I have to use the VGA(?) mode and although the resolution is similar (1280 x 960), the quality is poorer.

Hey everyone! I'm trying to set up MintNet on my TT. But I'm a
little confused. I want to boot driectly into AES4.1, which the
computer does now. But In order to use all that good stuff like
MintNet, init.prg must be run. It's been my experience that if a GEM=
line is specified in the mint.cnf file, it ignores the INIT= and
doesn't run init.prg. Now how can I set up my system to get init to
run before booting into GEM? I've looked at the problem a little bit
and decided that I need help ;-). Thanks for any help!

|It seems I had a program called Winx running at startup. Disabling it
|allows my folders to move quickly as outlines. I don't know what Winx
|does because the instructions are in German but I was able to understand a
|couple of words, one of which was 'redraw' and presumed it was telling my
|system to redraw the folders constantly while they were moving.

Winx is an excellent program if you have the memory and processor.
On the Hades I use Gemram which moves the OS into RAM and Winx which
patches various things and allows e.g. the redraw move which you
describe when the left button is used (and the outline move when the
right is used), also real-time scrolling of text in windows,
moving/closing non-top windows etc.

I have the same problems as you with the settings (German text) but
it seems to work fine.

|PS- By the way, LetEmFly is a confusing program which is basically a line
|of buttons on a bar for STinG and CAB in the upper right corner of the
|screen. If this is not the program then there is a mistake as such on the
|ftp site as this is what I downloaded and opened.

It probably should be in the AUTO folder. It puts move corners on
some boxes (i.e. allows them to be moved as if they were windows).

BIG snip

Hi guys, just a word of warning, Epson, and most other manufacturers won't fulfil a warranty if the printer has been refilled or had after market carts put in. Having had a lot of experience fixing HP, canon and epson printers, I can honestly say be bloody careful. Particularly with refills. I have found that the wrong ink will clog the heads beyond repair, in some cases. I have 2 Epson stylus printers and have to say they are the best BJs on the market tho. I can use them with 1st word or PS2 no trouble.

Mark

PS HP printers are always dying.

Hello!

JIL> The Eizo Flexscan 6500 (21 inch screen) works in ECL
> mode for TT High...

Sounds like a very useful feature, you may have just found
my next new monitor! Pity they don't make them any more, I
may have to find a second-hand one. Perhaps there's still
some sitting in a warehouse somewhere though.

JIL> ...on the Hades I have to use the VGA(?) mode and
> although the resolution is similar (1280 x 960), the
> quality is poorer.

I imagine ECL is a bit quicker than VGA (fair play, it /was/
designed for a 10" (visible diagonal) monitor! I work the
Flexscan 6500 out to be about 19" visible diagonal, probably
stretching the picture slightly larger than the TTM-195
would. For most people that wouldn't be an issue, and
it's probably better than squashing it onto a smaller screen!
:-)

Regards,
- Andy Ball.

Assuming you are able to get a decent DCE connection (say 42000 to 48000)
you should be able to achieve 4.0K to 4.2K cps.

But ... the net being what it is ..... much will depend on the loading of
your ISP and the target ftp site.

Pretty neat. I'll have to take a look at this. (running Nat32 on an old
Intel/HP server with dual 66 Mhz Pentiums/NT4).

4469. ATARI 1040ST Problem

Newsgroup: comp.sys.atari.st
Date: 2001-04-05 12:02:07 UTC
From: viper <e.pepping@datacase.nl>
Message-ID: <9ahmqf$g2t$1@porthos.nl.uu.net>
Source record: 48001

Hi All,

My 1040ST is acting a bit strange. One the problems is that the screen seems to be too small. It simply seems not to fit into the screen. A good relative told me to change it in the software, but the choice that I have to enable is disabled and won't allow me to enable it.
Please help me, I hate it to see the thing standing on a shelf, not able to do just anything with it but that.

I've also had a 1040ST system before this one. Including a monochrome monitor. Now I have a color monitor. Much better for me, but I wish I'd never changed my old one for a new one.

Thankx... Erwin

MiNT-Net 1.04 has built-in IP masquerading. The throughput is
about the same as 10mb Ethernet or sometimes better, because the
PLIP drivers are more stable than the Riebl drivers.

Hi everyone,
When I connect to Demon using MinTNet 2.0.0 I get

demuxprotrej:: Unrecognised Protocol - Reject for protocol 0xff

Demon then send a hangup signal , stopping the LCP.

Can anyone help me sort this out please?

many thanks,
Carl

4477. DSP problems?

Newsgroup: comp.sys.atari.st
Date: 2001-04-05 18:20:36 UTC
From: osian@zetnet.co.uk
Message-ID: <3accb774$0$8834@news.zetnet.co.uk>
Source record: 48014

Following on from the recent FVDI/Eclipse thread - I mentioned that I'd had problems with my DSP. I downloaded the DSPXBIOS path that was mentioned and I had another go. But I'm getting the same symptoms as I've always had.

Auto folder: JPEGD and DSPXBIOS, at the end of the folder after FVDI, NVDI etc.

Imagecopy locked up straight away. I then enabled xbiosfix in fVDI and rebooted. Imagecopy then loaded a JPG perfectly and I was very impressed with the speed!

I then tried Aniplayer and it played a .MOV file fine (as it always does), but trying to play a MPEG file produced an error "Communication error with DSP".

After leaving Aniplayer, I tried Imagecopy again and it loaded 20% of the JPG I was using and then locked up.

I then disabled FVDI and tried again, but with exactly the same results.

So, does it look like I've got a flaky DSP or have I just got the order of the AUTO programs wrong?

> MintNet, init.prg must be run. It's been my experience that if a GEM=

No, you don't need init.prg to do any of this, unless you want to use the
multiuser-facilities.

> line is specified in the mint.cnf file, it ignores the INIT= and
> doesn't run init.prg. Now how can I set up my system to get init to
> run before booting into GEM? I've looked at the problem a little bit

If you really want to do this, you must run init.prg and comment out the
"GEM="-line. The AES must then be run by init.prg. If you're not sure how
this work, you can take a look at my (now rather outdated) N.AES-page at
http://atari.nvg.org/n.aes/, this might give you some hints.

If you only want MiNT-Net though, you should try Marc-Anton Kehr's
"MiNT-Net for lamers", or for an even simpler (but a bit more limited)
solution try the beta-version of my own FMKS which you can find at
http://atari.nvg.org/fmks/. There are also links to Kehr's distribution,
so you can check out both.

Personally I've been using FMKS for a few weeks now, and I haven't had any
problems with it so far. It's also very easy to remove if you don't like
it, so IMO it's worth a try.

It's 99% complete, the only things that keeps me from releasing it is...

a) there's a but that cause it to crash on pre TOS 4.x machines.
b) I don't have a working Gcc setup anymore so I basically can't do
anything about it.

There are quite a few MiNT-users with CT2 Falcons, so it definitely should
work. I believe you'll need a recent version of MiNT, as I vaguely recall
that some patches was needed to support the CT2. Try www.freemint.de, go
to Frank Naumann's site from there and download FreeMiNT 1.15.10. Remember
to read the docs!

Hi Andy,
```

Totally useless info, but I once bought, just out of curiosity and because they were only £4.00 each, two A4 portrait monitors with ECL circiutry and vertical raster. After a few months fruitless ferreting for info re connection to my Falcon or ST, I dumped them. ECL, is a lot quicker than TTL, and totally incompatible with normal ST/Falcon video standards. Oh yes the mountain, its the Little Skirid, above Abergavenny.

Hi!

>I then tried Aniplayer and it played a .MOV file fine (as it always
>does), but trying to play a MPEG file produced an error "Communication
>error with DSP".

You'll get this if another program "locked" the DSP up. This may
happen if a program crashed badly and didn't unlock the DSP.

>So, does it look like I've got a flaky DSP or have I just got the
>order of the AUTO programs wrong?

I tend to put system patchs at the start of the auto folder rountine
as I thought this was the logical way. ie working from low level
(hardware eg HSModem) up high level (software Jinnee etc).

This method works fine for me but it depends on what you run.

I think you should download a demo from somewhere like James Haslams
site and run it under plain TOS, no ACC's or Auto's.

What hardware do you have installled? Nemesis? Could be a dry joint
cropping up or bad wire routing, need more grounding etc etc.

Unlikely to be the DSP, but I have heard of one DSP bummed up and it
half worked like yours.

Oeps I replied to quick. I notice you're using pppd 2.0.0. The noauth
command doesn't work with this version.
Furthermore the warning you got isn't caused by not having noauth.
I should say grap a newer pppd. AFAIK the latest one is pppd 2.3.11
With this version you must at noauth.

ftp://chapelie.rma.ac.be/atari/mint/daemons/ppp-2.3.11-1.m68kmint.tar.gz

I thought that might be the case, but it seems so unpredictable and
I've only been using Imagecopy and Aniplayer - would have thought
they'd be reliable!

>I tend to put system patchs at the start of the auto folder rountine
>as I thought this was the logical way. ie working from low level
>(hardware eg HSModem) up high level (software Jinnee etc).

It's always difficult to know at what level though. Most things I've
got are system patches or similar (fVDI, NVDI, HSMODEM, WDIALOG) and especially
with things like fVDI and NVDI you don't know where to put something
like DSPXBIOS.

>What hardware do you have installled? Nemesis? Could be a dry joint
>cropping up or bad wire routing, need more grounding etc etc.

The only extra I've got is Eclipse - but I had this DSP problem before
installing that.

Thanks for the advice. I just need to do a bit of experimenting and a
lot of reboots!

IIRC Winx offers some extra window functions for OS/AESs that don't have them.

>PS- By the way, LetEmFly is a confusing program which is basically a line
>of buttons on a bar for STinG and CAB in the upper right corner of the
>screen. If this is not the program then there is a mistake as such on the
>ftp site as this is what I downloaded and opened.

Then I think someone has the wrong program labelled as LEF. This turned normal non-window dialogs into flying ones - i.e. they could be moved on the screen with the 'asses ear' and also had some other functions. Probably redundant now with MagiC and later TOS/AESs. The button bar is more likely to something like Dock or a variant of AppLine...

>set.

Even easier, on most newer OSs you can get any character by holding down [Alt] and inputting the ASCII value on the numberpad. I even many, many years back bought a program for 30 quid that allowed you to do that on TOS 1.02 - still have it, never used :-(What I have done is written the ASCII values for the German Umlauts and sz in pencil to the left of the function key strip on my Falcon and STFM. Works fine! Only problem is that these upper ASCII characters have a different value on PCs and Macs, so a lot of mail written on them either gets funny characters there, or their hex-equivalents preceded by an '=' sign if they are using qp (quoted printable) mode on their mailer. I have set up a translator in Gale to deal with both, though I often do a search and replace manually in Everest.

>and decided that I need help ;-). Thanks for any help!

I don't use init; I boot directly into N.AES, using the GEM= command. The
/etc/rc.* scripts, which are usually executed by init, are executed by
MINT.CNF, with these lines:

```
exec /bin/sh /etc/rc.net #network deamons
exec /bin/sh /etc/rc.local #system logger
```

Hope this helps.

Hi Derryck,

Well, the main objective is to run a larger hardrive, CD-ROM, and
backup to Floppy Optical.

You are absolutely correct about the laser. I am finding this out
the hard way.

Even when left connected to the DMA OUT port on the Link 97,
when powered down (laser and SH204) the computer bombs when booting.

I can't Partition the SH204 with HDdriver so I am taking it out of the
chain. It's only 20 meg anyways.

The other problem I was having is with the Floppy Optical.
I put a disk in it and can't get it out. The drive light kept spinning
and HDdriver would not recognize it.
Tonight I tried a different Floppy Optical with no disk, and HDdriver
recognized it.
Do you know how I would go about Formatting (or Partitioning)
the Floppy Optical?
I can't seem to do it with HDdriver.
Only my SCSI drive and Syquest come up in the Partition window.
(maybe I have to have a disk in the Optical, I am not sure)

1.15.5, which I think is the latest 'official' version, runs fine on my
CT2 Falcon together with N.AES 2.0. Never heard of any CT2 specific
patch and surely didn't actively apply any.

If the floptical is really compatible with SCSI this should work.
HDDRIVER does not care at all what kind of device is connected. Any
device is treated the same way.

> Only my SCSI drive and Syquest come up in the Partition window.
> (maybe I have to have a disk in the Optical, I am not sure)

Yes, HDDRUTIL will not allow to partition/format devices without a
medium in it. Such a device is not displayed in the device selection
window.

Note that you can trace any action taken by HDDRUTIL and HDDRIVER by
using SCSI_MON, which is a part of the HDDRIVER distribution.

Emitter-Coupled-Logic. It's a method of connecting semi-conductor elements
to provide fast signal transmission. It's quicker than TTL
(Transistor-Transistor-Logic) but tends to consume more power.

Hi Roger,
So it should be around the same speed as CAB would download at!
Just a note here that at the time of my posting this question I had
confused cps (characters per second) with bps (bits per second) so I
thought I had a severe problem! I made the same mistake looking at CAB's
download rate. It also promted my post on modem efficiancy!!!

The software solution to using an Atari laser printer with a PC (or indeed practically any computer) is MagicSLM, available from the MISC section of my web site. You will need an ST to act as the printer server though.

My experience (a Link interface and SCSI drive) was that the computer would boot fine, but I couldn't access the floppy drive. Memory's hazy on this one, as it was several years ago!

>Do you know how I would go about Formatting (or Partitioning)
>the Floppy Optical?

I've never seen one of these I'm afraid, but I wouldn't have thought that you would have any problems.

>Only my SCSI drive and Syquest come up in the Partition window.
>(maybe I have to have a disk in the Optical, I am not sure)

FWIW, my Syquest EZDrive is recognised at bootup regardless of whether a disk is in the drive or not. The only thing you have to beware of is to set the maximum number of partitions you are going to be using on any removable disk, and something about maximum sector sizes.

Can't be of any more help I'm afraid.

Assuming yours are 1Mb 1040 STFMs, two things:

With a TV: play games, use art programs.

With a monitor (you can use an adapter lead on a PC VGA monitor) you can:

Use the ST as a MIDI controller for keyboards/modules etc.
(may need more memory than standard)
Use a text editor for letters.
There is other stuff but you'll need to buy more kit.

Hi Mark,

>Hi guys, just a word of warning, Epson, and most other manufacturers
>won'tfulfil a warranty if the printer has been refilled or had after
>market carts put in.
I'm aware of it... but by simply removing the refilled or 3th party carts and putting the original ones back in place, they'll have a hell of a job proving it.

>I can honestly say be bloody careful. Particularly with refills. I have
>found that the wrong ink will clog the heads beyond repair,
True, that's why I recommended "Renner", that firm was established some twenty years ago and some very large corporations and German universities buy their supplies from them... they sell OEM cartridges all over Europe, their own brandname is Tigiton (ink and paper...)
The ink for the Epson 850 is not waterbased ink, the particles are kept together by enzyms, the ink should be kept in a dark and a cool place (I keep it in the fridge), a dirty needle is enough to break up the enzyms, resulting in the ink breaking up and becoming unusable...
For people who like bying the original Epson carts, I can recommend that firm also, in general these carts are 40% cheaper than in the UK. Not to mention the other European countries where the price of original carts is ridiculous...

>I have 2 Epson stylus printers and have to say they are the best BJs on
>the market tho. I can use them with 1st word or PS2 no trouble.
Yep, I can vouch for that.
What I like about Epson is that they don't screw around with the control codes. The latest models of scanners and printers will still work with our "old" drivers...

Cheers from Belgium

Hi Bob,

>when these go, it'll be ink refills. The cost of their CD cut out
>papers and glossy paper is also very good. No doubt the germans do
>them cheaper, but it's the import cost!!!!!!!!
What do you mean? there are no import costs... the price quoted on the
website includes VAT. There's no duty to pay on goods coming from another
EEC country either. The only difference with the UK might be the shipping
costs, I've just had a look at their last invoice...
For 2 litre ink, 1000 pages of 110gr A4 paper and 4 toners they've charged
me DM37 (rougly 12 Pounds), which IMO is quiet reasonable considering the
weight of the paper.
Usally the ordered goods are delivered within a week.

>Still wondering at your knowledge, and waiting for your Calamus files
... sorry I completely forgot to mail the Calamus files, but they are in
your mailbox now...
Knowledge isn't important... making good use of it is what counts :-)

Cheers from Belgium

I only know what Rodolphe Czuba told me, that some modifications was done to MiNT to support the CT2's RAM. This was probably done quite early in the 1.15.x series (or perhaps even in 1.14.x?) as the CT2 is getting old now.

Your ISP is probably using PAP or CHAP. Have you configured this
correctly?

> Please, how do I set up a gateway address in MintNet?

With route, like in most other unix-lookalike network stacks. But this
shouldn't be necessary, pppd does this by itself as long as "defaultroute"
is specified in one of it's config-files.

Take a look at Mar-Anton Kehr's MiNT-Net stuff, there's a lot of useful
information on his web-site. You can find the URL at
http://www.freemint.de/ or http://atari.nvg.org/fmks/

>does), but trying to play a MPEG file produced an error "Communication
>error with DSP".

Aniplayer use only XBIOS for load the DSP program, if there are a problem
during this stage the system is locked (always in the XBIOS call because
there are no time-out). After it's different Aniplayer uses directly the
DSP registers, so this message 'Communication error with DSP' is a time-out
because there are no answer from the DSP after 1 second.
If you havn't an accelerator card, for me it's an hardware problem.
Maybe a bad contact of the GAL U44 is his socket. Maybe it's a problem
with the DSP memory, I don't know. Your Falcon is 'normal' ? Your DSP
is always at 32 MHz ?

Regards,

Didier.

Me too!

A long "me too!" thread would be really refreshing, don't you think? :-)

Seriously I am sitting with two TT:s on 640*480*16 VGA and would
definitly buy one if they are working OK on most serious apps. And yes, I
know at least one in my neibourhood (whatever that word is spelled!) who
would by one as well.

> Seriously I am sitting with two TT:s on 640*480*16 VGA and would
> definitly buy one if they are working OK on most serious apps.

What is stopping me from buying a Galaxy is two-fold:

1) Ethernet drivers still unavailable.
2) Ethernet interface is AUI.

Point one is especially important, because networkability has
priority over flashy graphics, for me. I currently have a Riebl
card, which covers my networking needs adequately, and would not
remove it to replace it with something non-networkable.

Point two is of economical importance: purchasing a separate
AUI-to-BNC or AUI-to-UTP adapter adds to the cost of an already
pricey product.

Personally, I don't think I will purchase a Galaxy card, unless
the standard BNC and UTP connectors are present _on_the_card_ and
at no additional cost. Besides, I could understand having to use
adapters on obsolete vintage equipment, but on a new and already
expansive graphics card this is completely unacceptable.

I have already requested from Mario that he include those two
connectors on his card. Perhaps if enough people request the
same, we could end up with a _much_ better card and stimulate
more purchases. However, Mario is not likely to upgrade his
design unless enough people politely ask and make it a point.

Yes, it's possible, but only for 720k disks unless you do a hardware
patch. To just use it as a replacemnt, you'll need to insert the
floppy cable upside down (I've never seen this harm a drive or
computer, but don't leave it on for hours around the wrong way).
Change the jumper (or solder bridge) to DS0 or ID0.

FamilyNet Newsgate

Hello!

O> someone design a PCI card for the pc that gives you an
> ACSI port, and write drivers for it so you can use
> atari laser printers on your PC aswell as the atari
> hard drives...

Well... I wouldn't mind a PCI card that basically had a TT on it. I've just deleted three paragraphs I wrote about how this could work, because nobody is likely to build it!

I've been swatting up this morning on how to write platform independent software, so I may be able to write code that will build from the same source on various workstations, including the TT. For some of the more simple stuff, I may be able to get it running on an ST. If the opportunity arises, I might get myself a TT to test software on.

A question that springs to mind is what environment to code for. My natural inclination is toward unix, because it makes for good portability. In many ways though, the ST is more like a combination of MS-DOS and GEM (probably because it's ported from them!) MiNT changes that, and makes the ST more like unix.

Simple text-based stuff will probably run happily in a TOSWIN window, or full-screen. If I write anything that needs graphics, a question arises: GEM or X? I know nothing about the state of X on the ST, apart from a vague recollection that it exists (existed?!). I have a gut feeling that GEM might be more efficient on the ST though, so ideally I'd like a library that provided access to GEM on the ST (and possibly on the PC under DOS in view of the work being done 'over there'). In a perfect world, the same library would be available for X, so I could write code once and build it in those three situations (TOS+GEM, DOS+GEM & unix+X) without it being hideously inefficient. Before anyone asks: no, I haven't written this 'Panacea' library!! ;-)

Regards,
- Andy.

This error always occurs with Aniplayer. Imagecopy (via JPEGD) can *sometimes*
communicate, sometimes producing an image correctly, sometimes getting
partway before locking up, sometimes getting partway and producing a
blank image for the rest of the picture, sometimes locking up right
from the start.

>If you havn't an accelerator card, for me it's an hardware problem.
>Maybe a bad contact of the GAL U44 is his socket.

Sounds like I'll have to take a look!

>Maybe it's a problem
>with the DSP memory, I don't know. Your Falcon is 'normal' ? Your DSP
>is always at 32 MHz ?

I haven't intentionally installed any hardware or software to change
the DSP's behaviour! As far as I'm aware, it's as it was when
installed.

Hello Dr. Seimet,

Everything working and partitioned.

C: - I: CORE (SCSI)
J: - L: SyQuest (SCSI)
M: Fujitsu (SCSI - floppy optical)

But when I Install HDDriver (.SYS file)
I get

C: CORE
D: CORE
E: CORE
J: SYQUEST
K: SYQUEST
L: SYQUEST
M: FUJITSU

Why only C: - E: and not C: - I:?

I choose C: CORE
driver successfully installed!

but when I reboot, I can only access CORE C: - I:
thats it.

why?

thank you

ken

Okami is news and mail and *it's compatible with every Atari OS* It runs
quite happy with Stik/STing/Gluestik (and even MagicMac/pc).

I only can confirm the words of Kenneth. In my eyes it far better then
Outlook Express, Eudora, etc... Although I'm having these mailers on the
Mac G3 I really don't use then at all.

Mail and News in a strictly _off-line_ reader. You vill need clients to send/receieve mail and news. There are several possibilities like using Soup packages, The KA9Q NOS, Tin (Linux/Unix) or with STinG and Popwatch/Newswatch.

My setup uses the latter. You will also need a separate editor like QED. Because of its flexibility it's a little hard to set up.

Start with STinG/STiK and when it works install Popwatch and Newswatch by Gary Priest. When they work it's time to setup Okami itself. Unfortunately it is still in beta (but runs very stable) so the documentation can be confusing. There is also a _big_ difference between 2.0 (release version) and the present 2.21 beta.

Okami is shareware with an annoing dialog showing up all the time but there are no other limitations. It is really worth to pay the fee.

It will run with standard TOS and Magic etc. It does however _not_ work with Geneva!

It can be downloaded from http://www.xs4all.nl/~josdb/okami.html

Media converters are a waste of money, it's best to buy a Hub with the neccesary ports, works out about 66% cheaper. Hubs can be bought for around $50 aus.

e-mail: atari@benjamin.net

I've just added 6 boxes of Atari ST Software, including some choice Games. So please checkout my Catalogs as they Grow! Not just ST Software! And I'm offering a 20% Discount to my regular customers! E-Mail me for Details on Redeeming this offer! I'd like to say Thank You for letting Bravo Sierra Computers Support you and your Atari Needs. Haven't bought from Bravo yet? Give Ben a Chance! I can be quite Beneficial. Remember, if you can't come see me today? Come see me tomorrow! Call Ben anytime at (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I think I said in a previous comment that emulation still seems to be a good way to go. The STeem programmers have done a good job so far and as the power of PC's continues to rise as prices fall things can only get better on that front.I only use my ST's for music and midi,home finance and some other relatively simple tasks so I've no real need to move on.

Chris.

4545. Power Computing's Hand Scanner

Newsgroup: comp.sys.atari.st
Date: 2001-04-07 09:34:04 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3acedf0c$0$8833@news.zetnet.co.uk>
Source record: 47982

Hi all!

I recently picked up a second hand, hand scanner (try saying that when you're drunk! :)) and it works really well in ST-Low resolution and OK in ST-High (I have a Falcon).

However with the software provided (Power Scan v1.03) I can only scan in ST compatible resolutions at a maximum of 16 greyscales in ST-Low.

On the scanner unit itself (a Mustek HT-105) it says it's capable of 400dpi (which I can get); and 64 greyscales.

Does anyone know if there was a later version of the software, perhaps with (more) Falcon compatability and to use more greyscales?

Or even if there is some alternative software capable of using this scanner at better than 16 greyscales (I've got Migraph's Touch Up v1.8x but no joy)?

Cheers!

James

>OK, so is popwatch/newswatch just an auto prg?

No, they are normal GEM applications but can be runned automatically from
a shell if you prefer that. This is also true for Okami itself.

The only drawback with this setup is that everything is so configurable
that you might endup spending more time trimming the configs than
actually use the programs for actual work :-)

Someone really should (together with Jos den Becker?) fix an
"autoinstaller" for a "Okami workstation" so more people could take
advantage of this program. Once setup its very easy to use not requiring
any special computing skills.

> So it should be around the same speed as CAB would download at!

Yes, they will both be using the phone line at around the same speed. When it comes to looking at reported transfer rates you have to be quite careful, though.

A file transmitted by ftp will usually be compressed. There is little opportunity for further in-flight compression by the transmitting modem. For this reason statistics derived from ftp transfers are usually the most reliable indication of "real" line speed.

Many files which come via the http route will be uncompressed at source (graphics, text etc.) and will be compressed by the transmitting modem. These are then uncompressed by the modem at you end which means that you will often see quite ENORMOUS transfer rates reported by CAB. e.g. many megabytes of source "0"s would be in-flight compressed to a few bytes which would then be uncompressed to the original string when received. So ... for the actual line transmission of a few chars you will receive many megabytes which will grossly distort any reported statistics if you associate them with line-speed.

It is the ftp speed which you should work on if you are trying to optimise network efficiency - reported "speeds" for http will confuse :-)

Mark, I already have a hub. Should I buy myself a deprecated AUI
hub on top of my current one (1xBNC+8xUTP) just to accomodate the
Galaxy?!

4554. Misc ST Items FS (USA)

Newsgroup: comp.sys.atari.st
Date: 2001-04-07 11:45:23 UTC
From: Fred Horvat <fmh@netzero.net>
Message-ID: <3ACEFDD3.E93EA933@netzero.net>
Source record: 47988

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

I have a real gem here. The only known stand alone Atari 2600
computer system made. The Bit60 Computer made by Bit Corp.
Spectravideo made an add on adapter for the 2600 console.
This is a fully functional computer and 2600 game system.
This is the 2600 computer system reviewed in
"The 2600 Connection" issue #30 Sep/Oct 1995. I am pretty
firm on the price since this is not something your going
to find at a local flee market or garage sale. $1,000.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Spectre GCR by Gadgets by Small. This is the Apple Macintosh emulator
for the Atari ST/STe/TT/Falcon computers. Includes cartridge, disks,
box, and an extra disk of misc ST utils. $30.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual.
$30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Hard Drivin' by Tengen. The awesome arcade game on the ST.
Comes complete with disk, docs, and box. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks
$10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk
$5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks.
$5.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope.
$45.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual.
$3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies
$15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual.
$5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk
$5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk
$15.00

BOOKS $5.00 each unless noted

Compute's Technical Reference Guide to Atari ST TOS Vol 3.
Includes fully commented C and machine language examples. $5.00
Thunder! The Writers Assistant manual. $1.00

MAGAZINES

I have a large selection of mostly 80's and early 90's Video Game and
Computer Magazines, Books, and Newsletters for various systems.
Please E-mail me for a current listing.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
Sept 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run.
$20.00

WANTED

MagiC Mac Ver 6.XX
CAB 2.7 or higher, full version or upgrade
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
MagiC Ver 6.XX for Atari, full version or upgrade
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,

OS/2, Mac, and Amiga. If interested please request a list.

From: David Bolt <nospam@my-ste.demon.co.uk>
Message-ID: <Z8XcCZRF4wz6EwIm@my-ste.demon.co.uk>
Source record: 47991

In article <9an17v$g95$1@news5.svr.pol.co.uk>,
Roger Cain <roger@cainr.freeserve.co.uk> writes:

>
>It is the ftp speed which you should work on if you are trying to optimise
>network efficiency - reported "speeds" for http will confuse :-)

Demon have provided a few test files on their FTP server to allow people
to check their download speeds. There are 3 different types of file: an
empty file, that consists of nothing but 0x00; a regular file that
consists of
"ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789!"$%^&*()_=+[]{}#"
repeated for the length of the file; and a full file which contains
(pseudo)random byte values from 0x00 to 0xff. The files are located in
<URL:ftp://ftp.demon.co.uk/pub/test/>

As a comparison, with a modem connect speed of 48000bps and serial port
set to 115200bps I fetched 'regularfile' (102400 bytes) at 10.03 KB/s,
'emptyfile4' (409600 bytes) at 10.37 KB/s and 'fullfile4' (409600 bytes)
at 4.91 KB/s.

Regards,
David Bolt

That would be a good idea. Is there a inf/cfg file for Gemsetup that
makes it copy files to certain directories and edit files? Or do you
have to compile the Gemsetup binary to do this? Like the one with
Aniplayer.

Well, I've been keeping my mouth shut, but I guess I'll talk now.

I got my GALAXY card about two weeks ago for my TT. It's a very professional piece of hardware. I didn't care about ethernet since I al;ready have a pocket ethernet adapter.

Anyway, it does use fVDI and a couple other programs. It supports from 640x480 at 16bit all the way up to 1280x1024 at 16 bit color right now with more modes to come (ie different color depths).

It appears to be running like a dream! All the image programs display their pictures in gorgeous color. SpeedoGDOS is actually runnning from 50% to 100% faster with fVDI installed! And all my "clean" GEM programs work like a dream. The only problems I'm having with it are:

Calamus - MGI and invers decided not to support 16-bit color depth, just 256 colors and 24-bit or higher color. This is currently being corrected.

Freedom2 - But then that';s not quite a clean program from what I hear. I've never been happy with it anyway.

Thing 0.59 - Its a demo, though. Demos of higher versions work fine. But my version doesn't say "Shareware" all over it. I guess I shouldn't be such a cheap bastard ;-).

Vision 4.0 - There's a problem with the driver handling the tool buttons. This is being fixed.

Other than that, everything else I run works like a dream, including GEMview, 1stGuide, TOSWin2, AtariWorks, IdealList, MultiTOS, BOXkite, Luna, qed, WenSuite, and CAB. The web browsers operate at almost usable speeds with the card since no dithering is necessary! Everyone with a TT should spend the money for this card if they want a better display! It makes a huge difference over the normall TT low and medium! I strongly suggest this card to anyone!

NO!

He doesn't want you to say "I recently picked up a second hand, hand
scanner"

He wants you to say "that"

Or "that when you're drunk"

Geez - when will people learn how to read properly...

;-)

BBS's may still, once more, ride supreme. The Internet is slowly and inexorably being hi-jacked by big-business... and even worse... by governments. Ask a chinese person in china about the "rules" they have to adhere to in order to access the web. Ask a person living in Singapore. In the uk the government is desperately trying to find a way to regulate the internet access for it's citizens and to provide themselves with control over content and taxation by using the chat rooms and internet porn as the vehicle to gain citizen's consent to this. They can't do that to a BBS even if they want to. It's like a pirate radio station to them. They know it's generally there but they have to find it before they can stop it.

The easiest way to create a BBS now is in Windoze. The easiest software I ever found to do this in Windoze is no longer actively supported, but it works just fine.

Pop over to http://www.winbbs.dynamite.com.au/ and get your copy.

You might not get a reply, because I notice that you keep changing the subject line. Most news clients recognise a message is part of a particular thread by the subject, and because you keep changing them when you do a followup message these have the potential to not get noticed.

Just a tip, mate.

Cheers!

I have here a Panasonic Image Scanner 256 Gray Level.
It scans A-4 sized documents.
Type FX-RS307.
There is a 25-pins connector but it is no SCSI!
It says PC-Interface. And I found out that it was used with a special
PC-card.
Does anyone know how it was connected to an ST?
I found software that probably drives it, but maybe not.

I think the main problem is to get hold of the ethernet controller used in the
Rieble card. Thaught it were LANCE ethernet controllers.

Next to the NS8590, the LANCE must be the most common ethernet controller
ever. I've got three cards/motherboards with a LANCE at home, myself.

OTOH, yesterday, I found the schematics for the TU-Wien LPR-card (bloody
misleading name, I thought it was their DE600 parallel port project) on
the Umich archive. It, too, uses the LANCE, a load of GALs, and works with
the Megabus.

Martin-ï¿½ric Racine <q-funk@funkyware.atari.org> skrev:
: On Fri, 6 Apr 2001, Kenneth Medin wrote:

:> Seriously I am sitting with two TT:s on 640*480*16 VGA and would
:> definitly buy one if they are working OK on most serious apps.

: What is stopping me from buying a Galaxy is two-fold:

: 1) Ethernet drivers still unavailable.
: 2) Ethernet interface is AUI.

: Point one is especially important, because networkability has
: priority over flashy graphics, for me. I currently have a Riebl
: card, which covers my networking needs adequately, and would not
: remove it to replace it with something non-networkable.

: Point two is of economical importance: purchasing a separate
: AUI-to-BNC or AUI-to-UTP adapter adds to the cost of an already
: pricey product.

Adds what? Two EUR?

: Personally, I don't think I will purchase a Galaxy card, unless
: the standard BNC and UTP connectors are present _on_the_card_ and
: at no additional cost. Besides, I could understand having to use
: adapters on obsolete vintage equipment, but on a new and already
: expansive graphics card this is completely unacceptable.

I can't see why you see that as a problem. Besides, space is rather
cramped on that card, and you'd have to drop one connector in order to add
the other. AUI offers the most flexibility. Most probably, TP and BNC
would add to the cost, since they would incorporate more electronics on
the board.

: I have already requested from Mario that he include those two
: connectors on his card. Perhaps if enough people request the
: same, we could end up with a _much_ better card and stimulate
: more purchases. However, Mario is not likely to upgrade his
: design unless enough people politely ask and make it a point.

In what way would those connectors make it a /much/ better card? It would
still be the same card, and it would go just as fast (or slow?) on the
ethernet.
Seriously, did an AUI transceiver bully you in grammar school?

/Iggy, who's got half a dozen AUI transceivers at home.

Atari is dying? Impossible! My studio is based on them: Falcon + Mega STE,
both fully loaded, and SGI Indy. Still the setup of choice :-) (though
should be upgraded to some Mac one day).
BTW: I doubt Moog synth are dead...

Hm, I tried to log in to that BBS with Telstar (STinG) and it did seem to
work. Did not try any games, though (never liked games...). All I got was
standard text but it shure worked.

Note the line "No Primary Interface available". This interface should be
connected to the Internet (your pc Ethernetcard). Fix this by setting
this interface as "Primary" (Showned in one of the screenshots on my
homepage).

You really should disable the Telnet and http deamons (security risk)!

And to the STinG users who read this. You thought STinG was too
complicated, welcome to pc world!

In case you haven't had a reply from Dr Uwe, I can tell you that for some reason HDDRIVER can only be installed on the first three partitions of a device, so that's all you will be offered under 'Install HDDRIVER'. As for the SyQuest and Fujitsu, are the IDs for these enabled in the 'Devices and Partitions' dialog? I find it's best to use 'Auto Configuring' in the 'Tools' menu to make sure.

And why wouldn't you want that? ;-)

>NVDI driver!!!!.

Uhm, NVDI was working on the Galaxy before fVDI was (the frame buffer
layout is supposedly the same as for FalconTC).
You probably wouldn't want to run it that way, though, since you'd get
no acceleration.

Anyway, NVDI has always worked with all graphics cards I know about.
Sure, only the ET4000 (at least that used to be the only one) has an
accelerated driver, but they'll all work if you disable the normal NVDI
drivers to force it to use another VDI (loaded earlier) for the actual
output.
You can even make NVDI use the original ROM VDI for output that way.

With an Eclipse/RageII, NVDI will slow things down, but you'll get
access to the vector fonts and such things. The same should be true
for the Galaxy. With a NOVA, NVDI would probably speed things up, though.

Hi Peter,

Thank you very much for your suggestion.
I used Auto Configuring.
Everything is working correctly.
wow! I made it!

The SCSI drive with HDDriver and screen accelerator is very fast.

Thank you Dr. Seimet, and newsgroup for all your help.

That's a feature of the Atari compatible partitioning scheme and applies
to any Atari compliant hard driver. If your drive has not more than 4
partition they can all be bootable. If there are more than 4 partitions
you can install the driver only on three of them. The fourth partition
entry is an XGM entry, which is basically the link to the remaining
partitions (additional root sectors).
It's the same layout with DOS/Windows, by the way.

Please see my other posting: This is a feature of the Atari compatible
partitioning scheme and has nothing to do with HDDRIVER.

> but when I reboot, I can only access CORE C: - I:

Please refer to the HDDRIVER manual for the removable media settings.I
think this has already been explained in another posting.

At present this is still a graphics card and not a network card, this would be an added extra.

> Point one is especially important, because networkability has
> priority over flashy graphics, for me.

I imagine the card would use a Realtek chipset so current drivers could be easily adapted.

> Point two is of economical importance: purchasing a separate
> AUI-to-BNC or AUI-to-UTP adapter adds to the cost of an already
> pricey product.

I agree that the graphics card is expensive (hopefully purchase volume should help this) but then the estimated price for the network card is quite small. If the media converter is really that hard to come by I am sure someone could donate one, maybe a flee market would have one. I would prefer UTP but then this is such a small problem that I think having the card is the main thing.

> Personally, I don't think I will purchase a Galaxy card, unless
> the standard BNC and UTP connectors are present _on_the_card_ and
> at no additional cost.

I simply think there is not enough room.

Maybe you could consider a ROM Port adaptor + Galaxy as your set-up instead, I understand this makes your current card redundent but you would have a nicer set-up.

Mark.

You think would have to make a BUS adaptor, you would have more luck with a MSTE (or better still a TT), plus they are quicker and would be able to process the larger screen areas better.

>Adds what? Two EUR?

Iggy, with all respect, but coming up with a card with networking
capacities and an AUI socket in 2000/2001 is, erm... inconvenient, I'd
say. I have my PC's networking and would surely like to add the TT
into it.
I'm working mixed 10/100 Mbit NIC's, so I use a switch instead of a
hub. Everything is on STP here, so I think ME's got a point: one's
forced to get/buy/search for another bit of hardware in order to
accomodate a new piece of h/w into one's existing system.

>/Iggy, who's got half a dozen AUI transceivers at home.

Well I don't, so I should go to one of these dump-markets first and
hope to find one there :-)

Just that, here in Australia 10meg is dyind and most 99.9% of hubs are UTP
only. BNC is even dissappearing fast as manufacturers try to save a quid. I
haven't seen any AUI connectors on new hubs in at least 2 years, so as I
said should be dirt cheap....

It prolly is SCSI....there is a 25-pin SCSI connection for SCSI1/2....PC scanners frequently didn't say so to justify adding the card

Hi FOlks,

I'm the UK rep for Mario's products.....I'm waiting to hear from Mario that the Ethernet kitted Galaxy is available as everyone seems to want that version ATM, I have a beta unit (running NVDI driver ATM, should be changing over ot the fvdi one this week) and I'm impressed by it, even though it isn't the production item....

Exactly my point, thank you. AUI is obsolete and inexcusable on
a piece of equipment manufactured nowadays. The added expanse of
the transducer is both economical and time-consuming, also.

Hi everyone,

I'm looking for a cheap external scsi cd rom drive, something like the apple cd150 or cd300 would probably do. Its to use on my atari st (via a scsi host adaptor) but more importantly for my akai s2000 sampler.

By the way, after more than 8 years its still wonderful to see activity on these atari groups! I sadly miss my TT but I'm still using the STE and love it!

Kind regards

Simon Williams

What makes AUI obsolete? Because it's not in fashion? By the same line of
reasoning, the TT would be considered obsolete.

1000FIM, is it that cheap? I thought it would cost at least twice as much.
However, if that's what they want for the transceiver, that certainly is
expensive. When you get the card, mail me, and we'll make a deal. =)

:> space is rather cramped on that card,

: Not that much.

You'd have to drop the AUI in order to accomodate TP+BNC.

:> AUI offers the most flexibility.

: AUI is crap and obsolete. Grow up.

I resent that statement. Both, in fact.
Define crap and obsolete.

While we're at it, why not add gigabit ethernet? After all, 10 Mb is crap
and obsolete, I suppose.

:> TP and BNC would add to the cost, since they would
:> incorporate more electronics on the board.

: One chip, one RJ-45 connector. Heck, even BNC is optional.

Maybe for you it is.
One way or the other, you're going to need a transceiver, whether on the
card or externally. It really isn't worth raising any fuss over, since
you'll get your network connectivity either way.

Dear fellow enthusiast,
My name is Nigel Stapple and I run a small non-profit company called Tekpromo. Our aim is to promote engineering and science in schools and colleges in the UK.

One of our services is a free mobile technology exhibition that includes a section on the history of home computing. We are currently looking for contributors to the exhibition who are willing to produce and supply information sheets on various machines. Specifically we require A4 size printable documents containing information such as specifications, history, pictures, trivia and of course any relevant information you would like to include (your web address!). All contribution would be gratefully received.

Our own collection stands at 30+ machines, including a TRS80 Model 1, a ZX81with thermal printer, an Amiga 1000, a z88, an Apple Mac+ (US version) and a Tatung Einstein. We have the usual mix of Sinclairs, Atari's, Amigas, Amstrads and some early PC's.

We are continually looking for more models for the exhibition and would very grateful for hardware/software contributions. We require Acorns, Orics, Commodores (8 bit machines), MSX's, and any other home computer familiar in the UK during the late 70's through to the 90's.

Regards

Nigel.T.Stapple
(Exhibition co-ordinator)

Hi Rob,

For me it is the TT also. But that is not
because I know what the other Atari's can do. I
just bought my first TT in 1989/1990 because it
was twice as fast as a Mac and twice as cheap!
Until now I still enjoy working on this machine.
In the flow of the time I've bought two more
TT's because I could not let them pass me. The
second one was from a professional architect who
sold it for about $ 330 US including Dynacadd
and Arkey with dongle. Arkey was about that time
the best design program for architects. The
bargain was also with the 19" screen. It was
about 6 0r 7 years ago and I took it all. Now
recently I've purchased a Falcon so I
investigating what this machine can do; explains
my lack of comparison. But my 'major' TT has 84
Mb RAM, a 2.1 Gb HD and a Nova graphic card.
Works all fine and there are hardly any pieces
of software that I haven't collected in the
years. Even these 'just to be' very expensive
professional programs. And until now I can make
a living with that old beast......

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 1 x Stacy, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx.

This is exactly what should be done anyhow.

Standards for 10mb Ethernet are well-established: BNC and RJ-45.
Nothing else qualifies, especially not AUI.

Raoul, could you tell us what you make for a living?

Given that most of us eventually picked up Linux or Windows to
comply with economic realities, it would be a highly refreshing
change to hear from someone who managed to stay completely on an
Atari to make a living, e.g. how you cope with people who expect
you to have the usual garden variety of Windows software or then
be "one of those Linux hackers" if you don't, etc.

Sounds very similar to my own collection.

Didn't realise I would be able to put it all in exhibition.

Oh well could have made some money there :-)

>>AFAICT you'd have to want to use fVDI to use the Galaxy as there is no

>And why wouldn't you want that? ;-)

Well ive already spent a lot of money on NVDI and since i know nowt
about fVDI i'd rather stick with that, and since NVDI is what programers
refer to when coding i'd rather stick with some sort of a standard..

>>NVDI driver!!!!.

>Uhm, NVDI was working on the Galaxy before fVDI was (the frame buffer
>layout is supposedly the same as for FalconTC).

But the driver cannot be passed on due to licencing issues.

Once I wrote it somewhere here, but let me describe the landscape again:
1 x Mega STE 4 (I never had TT since lots of MIDI software didn't want to work on it...), 1 x C-Lab Falcon MkII (couldn't find MKX...), 1 x SGI Indy R5000 (CSound & related), 1 x portable PC notebook (for writing), 1 x Mac SE/30 (no to let my wardrobe stand empty ;-) - the rest of the outdated Mac stuff was sold in the past years).

I used to own an Atari 1040 STE - my first one and I fell in love with it when I saw it for the first time. I enjoyed its ROM built-in OS and years ago it seemed to be the promised land of computing for me. If I had to - I'd point this one as the beloved one as it still reminds me of those days when the 8 MHz clock was a miracle. And I believe quite often it still can be. And a bit later - the beautiful Indy. But that's a different story. ;-)

Regards,
Andy

No it's not. It's black & white, very VERY slow, and you can't do file
transfers.

I used to play BBS games a few years ago, and there's no way that you can
get the sort of speed over a telnet link that you could over a direct
connection to a BBS. And the telnet links aren't very reliable.

I've tried to play MUDs with Telstar, Telvt102 and others, but it's just
not workable.

Cheers!

4647. CAB reading only partial pages with Magic 6

Newsgroup: comp.sys.atari.st
Date: 2001-04-09 23:37:26 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B6F795F8.103C8%nameerf@flash.net>
Source record: 47883

Hello!

I have an odd problem that's come up recently, and I'm not sure what I've changed, as it never happened before. When I look at some pages, especially large ones (atari.org is one of them), CAB won't display the whole page. Only the last 10-20% or so. I can go to a different page, and hit the "Back" button, and *sometimes* it displays more of the page, sometimes the whole page, sometimes just as much as last time. This is only using Magic 6.01. If I use Geneva or any other OS, everything seems to work fine. One thought was that perhaps it's a bad HSMODEM setting (as I use HSMODEM on Magic and Fast Serial on Geneva), but as it does in fact load in the whole file, which can be viewed as a whole in a text editor, I don't think that's it. Anyone else run into this problem? It happens with all versions of CAB I've tried. I've tried deleting and re-installing things, including the cache, and moving things around in different locations on my hard drive, but it's always the same. No other software is affected. Only CAB.

4648. Configuring STik 2

Newsgroup: comp.sys.atari.st
Date: 2001-04-10 00:14:12 UTC
From: vdjole@EUnet.yu
Message-ID: <9atj8h$b8u$1@news.EUnet.yu>
Source record: 47884

I have used STing for quite some time (currently STing V1.26), and I
decided to try STik 2 for a while. I found that it worked reliably,
as well as STing did (and in one important detail better than STing)
but I have some unresolved quistions about configuring it on my machine-
a MegaST with TOS 2.06:

* Recommended value for receive window is 4500. However, with the same
segment size (MSS=1500) in STing, receive window recommended by R.Andersson
was about 20000 (with some increase in allocated memory). Any suggestions?

* When STik 2 is used with recommended SLICE=1 or so, a small but
noticeable slowdown of the computer can be observed (about 10%; I noticed
this when testing some math-intensive routines). This happens all the
time the computer is running with STik, not just online. A slowdown exists
with STing too, but it is no so pronounced. Only if I select SLICE=10 and
YIELD=1 the overall computer speed with STik is similar to that with STinG.
Setting YIELD=0 slows the computer even more. Any suggestions for setting
SLICE on a MC68000 Atari? Docs say SLICE=0 is fine for MC68030 and should
be higher for lesser systems- but how high? Would SLICE=10 have any adverse
effect on STik's performance online?

* AFAIK STik 2 is to be effectively used mostly (only?) with a dial-up
connection contrary to STing which can be used in diverse manners.
So is there a way to automatically disable STik when it is not online?
This is related to my previous question about slowdown. What is the
use of STik running without a connection? STing has a CPX in which it
can be set "inactive" - although manually only. An automatic switch
option should be possible, shouldn't it?

Hello everyone trying out Sting.

Now I have at last ended this dead projects: Sting/all sort of CAB.OVL/Newsie.
Never more for me!
I just have had trouble vith it all: Slow mail/news, slow browsing. Nothing worked like before.

So I just got it all away from my HD and started over where I once started: Iconnect, Emailer, and the original CAB.OVL.
Now it for the first time, since the last half year, is possible to use the internet connection without thinking "if I only had an IBM-clone of any kind".
I suppose the average rate of transferring is now about 2500 bps, compared to 500 when I was using Sting. The only annoying thing now is the lack of Java.
So I will continue using my Falcon for some more time, and never ever try out Sting any more.
Where is the ICQ for using with Iconnect? (I sent some money to the swedish developer and hope he soon will give me a version for Iconnect! I will pay once more for it if you are able to make it!)

Perhaps some of you can get Sting working with Mint or something.....
And of course I respect all the job people have done with both Stik and Sting, but for me and my Falcon/Magic it was no success.
Getting rid of Sting and using just Iconnect got me believ in the Atari connection to the www once more.

Hoping to put an end to this discussion about AUI vs. twisted pair:

I could put a twisted pair interface on the card, but for the volume that I anticipate selling, this would be *more expensive* than buying an off-the-shelf twisted pair or thin coax transceiver (which costs about USD 30 new, and can often be got for nothing second-hand). If you really can't find one, I will be able to supply the transceiver with the card.

At present this is an academic question because the card does not even support ethernet yet. I intend to support ethernet, I would have liked to support ethernet by now, but I just haven't had the time. I am still working on it.

I can say that as a Graphics card it is slowly getting better and better, since I am putting much of my free time into fixing compatibility problems with nasty software and improving the the drivers and firmware. This is a *long* process, and it will be a while before the drivers and firmware realise the full potential of the card, but it is getting there slowly.

Regarding NVDI/fVDI - the card can work with only NVDI, but this is a silly way to use it since you don't get any acceleration. With fVDI you get accelerated drawing - at present this is just a few operations, but already makes a *huge* difference to the speed of the display - when finished it will be even faster. You can run NVDI with fVDI if you want to get the use of NVDI's outline font handling and printing while getting hardware accelerated drawing from fVDI. The other big benefit of fVDI is that it's free.

Lastly I would like to say that this is not really profitable, it is a labour of love, and I do the best that I can with the time that I have, which is very little. This is also why you do not see me on the usenet very much.

> I've changed, as it never happened before. When I look at some pages,
> especially large ones (atari.org is one of them), CAB won't display the
> whole page. Only the last 10-20% or so. I can go to a different page, and

I noticed the same behaviour sometimes too. The whole page is there but
the slider is missing. If I just resize the page a little bit (with the
sizer widget), the page is redrawn with the slider.

I do not recall if the same occured with Magic 5.13 or not. In the case
it's just with 5.20 and the later, maybe it have something to do with
windframes. Another thing coming in mind is the size of the slider
defined in Cab.

Bye,
/Pascal/

4656. Need advice on reading SCSI ATARI Hard Disk with a PC

Newsgroup: comp.sys.atari.st
Date: 2001-04-10 11:11:50 UTC
From: Ricky <1@a.net>
Message-ID: <cUBA6.396$FD1.60313@news6-win.server.ntlworld.com>
Source record: 47892

I have tried using Gemulator Explorer but I can only see the first
partition.
What im basically trying to do is convert my old Atari cubase arrangements
from the hard disk so i can use them in Cubase on the PC. Is there a way to
convert all the files i want straight into the PC?
Thanks in advance for any help.

Yuck, Halvard, my CT2 Falcon polishes the floor with my AMD 500 win box. FPU is still about 50% faster on the Falcon030. I expect MagicMac or even PC would be different tho. I will never speak ill of my loves Atari, Fender, SKB, Daughter, Dog, oh and wife;-). I will never sell another Atari or Guitar. I learned..

Mark

4658. Re: Crazy Dots problems resolved (nearl

Source record: 47895

Hi Harry,

I have already sent you a mail message with all related info (NVDIVGA.INF, ASSIGN.SYS, auto folder order, etc), but for anyone else who is interested here is the message;

If you look you will see that the MAGIC boot program is disabled, it was near the end but I have been experimenting with it - in general I will not be using Magic until I get this working (i.e. it does not work with TOS either).

The REDIRECT program is the first, it says something like "640x480 blah blah". At this point I understand that ALL TOS output should be redirected to the CD card, but I actually get nothing until the SLCT_DEV program has finished running (i.e. unless I guess I can not change resolution on boot).

I have tried to reinstall NVDI but it did not help, I have not checked to see if when double clicking on a .TXT in TOS displays it with very strange characters. I do not think this is like when you try and display a RSC file or something it was strange, I will test tonight.

Any thoughts would be good.

I have also checked my CD card and it says Crazy Dots VME and has the 15Bit extension (which I believe is what I have it set-up for).

AUTO
====
REDIRECT.PRG - I understand that it sends output to CD card
MAGXBOOT.PRX - Starts Magic, was near the end
WDIALOG.PRG - Don't know
DMIRROR.PRX - Don't know
NVDI.PRG - NVDI replaces a number of system routines for faster ones
DRIVIN.PRG - Part of the repalcement port routines of HSModem
MFP_TT.PRG - Part of the repalcement port routines of HSModem
SCC.PRG - Part of the repalcement port routines of HSModem
SOCKETS.PRG - Something to do with IP but not sure what program it relates to
DRACONLD.PRX - IP stack for Draconis suite of software
STING.PRG - IP stack for most ofther programs (CAB, etc)
TRAPPER.PRG - I think it is used for Magic but not sure what it does
MAGICSND.PRG - Magic sound related file, not sure what it actually does
SLCT_DEV.PRG - NVDI program to select resolutions
EXTERNDOS.PRG - CDROM drivers

NVDIVGA.INF - My VDI file with a number of resolutions, all work
UNIDRIVE.DOS - CDROM driver
INSTALL.LOG - Not sure
EXTERNDOS.BAK - Backup of CDROM driver
CD.BOS - CDROM driver
STING.INF - STING config file
EXTERNDOS.CNF - CDROM driver config file

ACC
===
COPS.ACC - Control Panel replacement
DRACONIS.ACX - ISP diler for Draconis
DRTIME.ACX - ISP connection timer for Draconis
CDCTRL.ACX - CD player program
KOBOLD_2.ACC - Copy prgoram that appears to have stopped working

Ok so now I've got Mint working perfectly under AES 4.0, reasonably under XaAES, but yet to try AES 4.1 or OASEs. 2 questions. 1: is N.aes any good? 2: is AES 4.1 sufficient for most things? I love the fact that 4.0 is essentially TOS, it saves a lot of buggering around with mint.cfg etc. Also is there a program that will shutdown XaAES on CT2 without killing the system?

As always. Thanks

Mark

Ricky,

The only way I've been successful at doing this is to use a Macintosh running MagicMac
and copying the contents of the disk to the Mac's hard drive. Then copy the files either to
a Zip Disk or burn onto a CD.

>beta's do not have, is it any faster?.

Not as far as I know, the last beta was released after the official 2.5 went
on sale:

*** jinnee 122 (31.8.2000)

Neuerungen:
==========

ï¿½ "Bugfix" beim Suchen angemeldeter Applikationen: Jetzt wird auch der
Pfad beachtet. Existieren mehrere Programme gleichen Namens auf der
Platte (z.B. unterschiedliche Programm-Versionen) und sind diese auch
mehrfach angemeldet, so werden jetzt die "richtigen"
Programmeinstellungen gewï¿½hlt, je nach dem, welches der Programme man
startet.
Wird kein angemeldetes Programm mit komplett ï¿½bereinstimmendem Pfad
gefunden, so werden wie bisher die Einstellungen des ersten
angemeldeten Programms (mit ï¿½bereinstimmendem Namen) benutzt.

ï¿½ Beim Erzeugen des Icon-Fehlerprotokolls (*.err): "Doubly icon name
..." in "Doubly assigned icon name ..." geï¿½ndert.

ï¿½ Noch ein paar kleine Korrekturen in der englischen ï¿½bersetzung.

ï¿½ Das Vorhandensein der MagiC-Objekte wird nicht mehr durch ein
vorhandenes MagiC sondern ï¿½ber die System-Funktion "appl_getinfo"
abgefragt. Unter dem neuen N.AES sollten daher jetzt auch
MagiC-Objekte statt eigene Userdef-Objekte benutzt werden.

Basically, a couple of minor bugfixes.

If you are using PPP you can skip that entry entirely. If using
SLIP then you should use it and with STiK2 having too large or a receive
window can reduce your connection efficiency. I did alot of experimenting
with that.

>
>* When STik 2 is used with recommended SLICE=1 or so, a small but

>effect on STik's performance online?
>

Yes and no. You can change the SLICE value dynamically from the
tools section of Qdialer. There will be a speed where you will be
happiest with your setup. Set it there. Sorry that is so vague of an
answer. A value of 10 on my TT did make for a noticeable slow down of
transfer rates. However this was a small reduction in the rage of 2-5%
maybe. Possibly even lower than that. However I was able to notice that
when I took it back down after using it at that rate for a few days that
transfers were overall slightly faster.

For a 68000 you run into the opposite problem. If you put the slice
too low then you will see an overall system slowdown, which in turn can
adversly affect your transfer rates.

>* AFAIK STik 2 is to be effectively used mostly (only?) with a dial-up
>connection contrary to STing which can be used in diverse manners.
>So is there a way to automatically disable STik when it is not online?

>This is related to my previous question about slowdown. What is the
>use of STik running without a connection? STing has a CPX in which it
>can be set "inactive" - although manually only. An automatic switch
>option should be possible, shouldn't it?
>

There is no way to set STiK2 to off. If it is running it is
running. However if there is no connected port the overhead it performs
is greately reduced. I would guess that from what you are saying that a
SLICE of 10 or even possibly higher would be good for you. If you don't
do any programming etc that would use the TCPIP stack except when online
you could try the following.

In DEFAULT.CFG set SLICE = 200
Then in your dial script or in Qdialer Set Slice to 10

This should put stik fairly far on the back burner until you run qdialer.

From: Joshua Kaijankoski <gaiyan@vianet.ca>
Message-ID: <cWFA6.238$6P3.1642@newsfeed.slurp.net>
Source record: 47800

Hi, I'm trying to overclock the DSP on my Falcon to ~50Mhz without success. I have a C-Lab MKII Falcon. I know I'm supposed to cut a trace under the 32Mhz oscillator on the mobo but there is none. What I did was buy a new 50Mhz oscillator, lift the pin on the DSP off the mobo which gets the clock signal from the crystal and solder a wire straight from the new oscillator to the DSP. Everything booted up but a DSP benchmarking program crashed and Aniplayer wouldn't communicate with the DSP. I soldered the wire from the DSP pin back to the 32 oscillator and everything is back to normal. I'm sure I did everything right so I'm blaming the 50Mhz oscillator. I tried several other though with similar results. What kind of oscillator exactly should I use and what experiences have you guys had? Thanks.

Joshua.

can anybody help me?
i am currently doing a dissertation on the music side of the atari st. basically i am interested in what actually happened to the company. i am aware of what the company was predominantely involved in (games etc) however it strikes me as quite odd that didn't continue to promote the computer down the music line. After all, they put an in-build MIDI port on the thing and as we know, even today some people still use them in the studio. Thus i am interested to know why the company failed to see this as a valid avenue and pursue it by competing with apple, ibm and co. They could now be dominating the music making market with an atari that is capable of handling audio as well as just MIDI. anybody that can help me with anything will be truly appreciated.
thankyou.

>use and what experiences have you guys had? Thanks.

Mines going along at 50Mhz fine. I know others who have had it up to
64Mhz. Your method seems fine. You may be unlucky and have a slow
set of SRAMS or they don't like oc'ing. Look at the 3 SRAMs near the
keyboard connector and tell me the code on them.

>more BBS's like this. :)

Great! I plan on keeping it up, forever, if I can. I think the BBS
fills a niche -- email is personal. IRC is too direct, for some delayed
discussion. Usenet is worldwide. The internet bbs canbe reached worldwide,
but encourages a local feel, while giving the conveniance of usenet or
email, and some games. Its all good. Primitive, but good.

When I get a DOS emu running in there, too, it'll rock -- DOS door
games mixed in with Atari door games. It will happen! :)

Just keep "calling", and tell everyone you know; without regular
users, it'll die :/

jeff

>No it's not. It's black & white, very VERY slow, and you can't do file
>transfers.

Its not B&W once you set your display options in the bbs; it
shoudl not be very slow -- it shoudl appear to be about 19200 speed,
unless your net connection is the factor (I'm in Canada; if you're in the
UK, coming across the oceans may be slow... I can't help that ;)

File Transfers are not yet supported; if you want file transfers,
I can open up the ftp site and you can use the web. BBSes were not focused
around file transfers, though of course it was popular. Its just not
needed these days, though I do plan on putting some old ST and Amiga warez
up there, for old times sake (mind you, very few telnet apps can do
Zmodem; you might as well just use the web.) I do have a web archive of
some bbs software for the ST, if you need.

>I used to play BBS games a few years ago, and there's no way that you can
>get the sort of speed over a telnet link that you could over a direct
>connection to a BBS. And the telnet links aren't very reliable.

Youre 100% wrong :P

I get 100MB connection to the bbs via telnet; you telling me a
38400 or 56k modem can top that? Hardly. Study up on IP protocols.

Telnet is as reliable as your telnet client and server; this bbs
is an Atari ST emulated under unix.. its still a little flaky, but its
hard no downtime in 3 weeks. Try that with windows ;)

>I've tried to play MUDs with Telstar, Telvt102 and others, but it's just
>not workable.

People have been doing it for 15 years; its very workable.

What woudl you wish to download?

I'm not interested in supporting MP3 downloads ,or ST game
downloads, since those are so well down at other sites. I'll support BBS
related stuff, and ST applications, since no one else keeps that (people
onyl tend to care about ST games :(

Telnet doesnt' do file transfer well, but I do have a website for
downloads.

>CAB.

I think you need to establish first whether this is a comms problem or
a CAB display one. Take a look at the source code - either in a text
editor or by using the 'Source' button in CAB. If it's all there then
there is something interfering with the full display, but it won't
have anything to do with HSDMODEM. If only part of the file is there,
then further tests are needed. I suspect it *is* all there but CAB
isn't displaying it. Perhaps it is having problems with one of the
graphics. Try switching these off temporarily ('Don't show', 'Text
instead of images' in Display Options) and see if you get all of the
text. Use the cache tool and see if you can display the document from
the cache. Also try removing all AUTO folder and ACCs and reinstating
them one by one to see if they are the cause - something may be
clashing. Or could you be out of memory? Some info about your setup
might help diagnosis.

Regards, /Peter/

4674. Re: making a living on Atari (was: Re: What's Your Favorite Atar

Source record: 47809

Hi Martin-Eric,

>Raoul, could you tell us what you make for a
>living?
No problem at all. I am educated as an artist and generally design all my work on the Atari for, as i allready wrote, the past 11 years. But because my own 'autonomous' work hardly pays off I subscribe to many public assignments for artwork in the public space or at public offices from the local or national government. I think I made about some $ 200.000 US in these years. I start applying with writing a letter in Papyrus, export it to Calamus supported by an own designed c.v. and small booklet containing photographical reproductions. When an assignment is obtained I start in, for instance, Cybersculpt to make the wireframe sketch or real proposition. Finishing it off in either Xenomorph or NEON and use Photoline to boost it up where necessary. Import the file into Calamus and prepare a total report concerning a financial calculation from Texel and also in-depth graphic outlays and textual addition about my plan.
Beside that i work as an art theorist for some magazines which I allways supply with an export file from Papyrus. The little time that it is left is been used to write a thesis for the postgradual cultural analysis department here in Amsterdam.

I also give lectures and prepare as a curator exhibitions which are all being written and printed out in Papyrus or Calamus.

For collection as much as needed material regarding the site for the artwork I use an Olympus Camedia 2020 camera which pictures can be loaded in the TT by Phototip.

I also do some graphic design work (poster design, book design, etc) with Calamus.

These are some of the major issues concerning my professional life but there are also some minor

occupations that still can bring in some money.

And about the comptability: I print it all out myself (using the Starscreen module in Calamus for excellent results) or got to one of the last printing offices that still can work with Calamus files.

So there is still life in the 'old beast' and because I dislike working with cracked software I've bought all what is necessary new or secondhand. If I'll have to switch (God beware me) to another platform its gonna cost me a fortune for new software. Let alone the new machine....

I hope that this gives an insight.

4677. Mega ST/Mega STE Keyboard Common Problems

Newsgroup: comp.sys.atari.st
Date: 2001-04-10 20:20:28 UTC
From: phantomm@bellsouth.net
Message-ID: <gWJA6.1616$6R5.87282@news1.atl>
Source record: 47810

I have several Mega ST and Mega STE Keyboards that look like they are in
very good condition, but all seem to have the same problem.

The problem is that some keys work fine, while others require alot of pressure
to register. And some keys just don't work at all.

I've never taken apart a Mega ST or Mega STE keyboard before.

However I would like to try and fix these. What are some of the common
problems that causes this on these boards?

And what is needed to repair these boards, without having to buy new
replacement parts?

Are there Key copper contacts that may cause problems if they get dirty?

I guess that in some keyboards the main keyboard IC could be bad, is there
anyway to test these ICs for working condition without having to replace
the chip?

Also, are there any diagrams of these keyboards on the Net somewhere?

On a similar subject

I'd like to connect a Mega ST or Mega STE keyboard to a Falcon motherboard.
Anyone have a DIY project instructions for installing a connection on the
Falcon motherboard so that I can just plug in the Mega ST or Mega STE keyboard?

I'd like to fix a connection just like on the stock Mega ST/STE Computers.

Any help with this is much appreciated.

>and obsolete, I suppose.

Erm, well may be not crap. It would be the same when Milan GmbH would
finally at last introduce the Milan-060 with a 360k SS diskdrive. We
all know it's not going to happen (and that's not because no SS
diskdrives are available)

Or the Coldfire replacement with the same thing. (Yes Uwe, ROTFL!)

Meanwhile, while very likely no Atari is being used any longer in
large office setups, 10 Mb ethernet capacity would be more than enough
for most users.

Mario, first thing is I appreciate you spending time on developing new
h/w for this old stuff.

Personally, I think you should go for the UTP/RJ45 connectors, even at
a slightly higher cost. While the card is intended to get Atari owners
to a more today's standard, why not the ethernet stuff coming with it?

Strictly my opinion :-)

The keyboards are these crappy rubber bubble contact jobs rather like
nintendo/sega joypad contacts. You have to pop open the keyboard and then
clean the contact pad
and the contact PCB etchings with isopropyl alcohol. That should clear it up
fine until the next time they get dirty. I've had to do that to a few
keyboards.

They did, it was called the Falcon and it was too little too late.

Basically it boils down to the fact that Jack Trameil was a dinosaur who was woefully out of touch with the way the computer business of the late 80s and 90s worked and still throught the same tactics that worked when he introduced the PET and C-64 over at Commodore would still work with his Atari computers.

It didn't.

The combination of non-existant marketing, lack luster efforts at maintaining a cutting edge in the computer industry, lack of focus (are we a computer company or a videogame console company?), and constant delays in releasing new technologies (delayed to the point that they were already obsolete when released) are what killed the company.

The non-existant marketing was probably the biggest nail in the coffin though. Most people didn't even know that Atari ever made anything other than the Atari 2600 and the 8-bit Atari computers.

They also should have looked at lisencing the operating system out to clone manufacturers from day one instead of waiting for the system to die before doing it.

Atari had a great opportunity when the ST came out. Serious technology critics predicted that the Atari could be the machine to finally topple the IBM PC. Unfortunately Atari sat back and did nothing while the competition overtook them and when they did release something new it was always under powered, over delayed, and under promoted. Mere words are not enough to express the disappointment many Atari users feel over the opportunities Atari let slip through their fingers.

But on the one hand, we can pick up these neat machines for a couple of bucks at flea markets and thrift stores and download most of the old software off the internet with our PCs and Macs.

I don't plan on giving up my ST anytime soon. It's the central part of my studio. It's a much better machine for Midi than my PC is.

Shutdown in XaAES is not yet implemented.
(Note that it is a project under construction)
What it does at the moment is kill all its clients and exit().
If XaAES is ran from mint.cnf then MiNT will halt as well.
If XaAES is ran from a console or the ROM aes, its shutdown behaviour must be
considered undefined.

PS
MiNT working under XaAES. Hmmm, I like that. ;-)

Hi Jeff!

>Its not B&W once you set your display options in the bbs; it
>shoudl not be very slow -- it shoudl appear to be about 19200 speed,

Yes very slow compared to connecting to a BBS directly at 115200 with MNP5

>unless your net connection is the factor (I'm in Canada; if you're in the
>UK, coming across the oceans may be slow... I can't help that ;)

Yes that is it exactly. It may be fast if I was connecting from around the
same town, but the Internet is slow when you are connected from another
continent...

>File Transfers are not yet supported; if you want file transfers,
>I can open up the ftp site and you can use the web. BBSes were not focused
>around file transfers, though of course it was popular.

Until the last few Atari BBSes closed here in the UK here, I still logged
on for their files, even though I was on the Net too. Most BBSes had a far
wider variety of interesting files than any FTP site I ever found, plus
they were easier to search.

>>I used to play BBS games a few years ago, and there's no way that you can
>>get the sort of speed over a telnet link that you could over a direct
>>connection to a BBS. And the telnet links aren't very reliable.

> Youre 100% wrong :P

Actually I still think I am 100% right and you are 100% wrong.

>I get 100MB connection to the bbs via telnet; you telling me a
>38400 or 56k modem can top that? Hardly. Study up on IP protocols.

100MB is not a measure of speed of connection. If you said 100MB/minute that
would make more sense, but this is not the norm for internet users. I've a
33.6 Kbps modem but even with this, the net scarecly ever reaches that
speed.

>Telnet is as reliable as your telnet client and server

Which is rubbish, which is what I've been saying all along,
Stik1&2/Sting/Gluestik users have crap Telnet clients.

>>I've tried to play MUDs with Telstar, Telvt102 and others, but it's just
>>not workable.

>People have been doing it for 15 years; its very workable.

Yes on PCs etc, but not on Ataris.

Cheers!

Sorry XaAES under mint;-). I noticed that after I got it running it was
having some difficulty redrawing the screen correctly, and crashed a few
times with software that was fine under 4.0/4.1. It was faster than 4.1,
which I loaded last night. As you say it is Beta so don't expect miracles.
But I found 4.1 to be more stable. I would like to use a Freeware AES, to
see what all the Magic fuss is about. I think an OS shouldn't cost hundreds
of dollars. Take note Bill.

>Yes very slow compared to connecting to a BBS directly at 115200 with MNP5

shrug I'm emulating an Atari ST; due to costs, I'm only willing to put it on a P90, so there is a speed cap right off the top; but that suits me fine.. its there to both relive the good old days, and simulate them well -- it tries to cap off around 19200 or 38400 depending on a lot of variables, to give it a authentic feel without slowing you down much. (I used to simulate 2400bps, but man that pissed a lot of folks off ;) I stopped running my BBS after about 8 years, around the 19200 days.

>Yes that is it exactly. It may be fast if I was connecting from around the
>same town, but the Internet is slow when you are connected from another
>continent...

A shame, that. Hopefully it'll get better. I've had some very good speeds to the UK and Africa, so it must just be luck, or time of day, or the like. I admit my client isn't particular nice to remote clients -- it doesn't emit in a controlled and buffered fashion, so perhaps thats killing the speed. It emits char by char, for ease of emulation -- the BBS doesn't buffer output, and for prompts and such to work, you can't easily buffer things. (ie: I could perhaps smarten the client -- emit in line or multi-line spurts, andif the bbs doesn't emit anything for a few moments, emit what it has so far. That could help..) (When I say client, I mean the telnet server <-> BBS gateway client)

>Until the last few Atari BBSes closed here in the UK here, I still logged
>on for their files, even though I was on the Net too. Most BBSes had a far
>wider variety of interesting files than any FTP site I ever found, plus
>they were easier to search.

Still; I have no back archive of files to offer, so the bbs cannot add much; furthermore, my website can do a much better job, since its not hosted on a P90 and is hosted on a nice server; lastly, I think the bbs niche is for community, game playing, fido, and other communications. Files are best left to specialists at this point, I think. I'm trying to make a balnce here.. if I wanted to do bbs'ing hardcore, I'd make it dialup only (liek a friend of mine, actually).. but thats hardcore, and not useful. Theres a reason no one ever made an ST online bbs before :)

If you have any old BBS files or door games, please let me know. Its hard to find them nowadays, and most of my floppies are long bad. If you can help out and send any files, I'll put them up on my archive, and if theyr'e door games or useful utils, I'll put them into the bbs.

>>I get 100MB connection to the bbs via telnet; you telling me a
>>38400 or 56k modem can top that? Hardly. Study up on IP protocols.
>
>100MB is not a measure of speed of connection. If you said 100MB/minute that
>would make more sense, but this is not the norm for internet users. I've a
>33.6 Kbps modem but even with this, the net scarecly ever reaches that
>speed.

Fair enough; I've got 100MB LAN supporting this bbs, and some big
pipe coming into it; the pipe and uplink are reasonably unsaturated, and
typically I get 300kps file transfers without trying. Its pretty fast. I
can speed up the bbs and modem client software a bit, but I've already
spend thousands of hours bringin the emu to life, so I'm not in a rush
right now to speed up the componeents for little return. If the net
inbetween you and I is slow, tis a shame :/

>Which is rubbish, which is what I've been saying all along,
>Stik1&2/Sting/Gluestik users have crap Telnet clients.

Ah, well -- 99.9% of the world isn't Atari based. The atari stuff
works.. I made sure it would, but realisticly, I'm not going to cater to
any particular software implementation of telnet. I haven't the time. But
this system is there to remember Atari for all of us who don't use Atari
anymore, though we wish to. (I'd kill for an STBook, though, thats for
sure ;)

Sorry it doesn't meet your needs. Please tell your friends.
Perhaps their connection is better. The BBS needs users to help bring it
life.

>>People have been doing it for 15 years; its very workable.
>Yes on PCs etc, but not on Ataris.

I never narrowed it down to Ataris; if the client is bad, and the
machine is slow.. I'm not responsible :) Course, I imagine a Falcon shoudl
fly for telnet.

I do miss Flash, though, and all of the plugins I wrote for it :/

From: nickd@enteract.com
Message-ID: <9b0klg$3p5$1@bob.news.rcn.net>
Source record: 47822

Greetings fellow Atari users,

I am trying to use NVDI 5 with my NOVA graphics card, with no success. From the NVDI FAQ on the "2B" (Behne & Behne) Web site, I found out that in order to use NVDI with the NOVA, the NOVA VDI version 2.61 or later is required. The latest version I have is 2.52, so I'm trying to get 2.61+. Last October I sent email to Nima Montaser (of Homa Systems House, who used to sell NOVA cards) and after about 2 months, I heard back from him asking me if I still needed it. I replied that yes, I did, but I haven't heard back from him since (even though I've sent him a couple of followup messages). As far as I know, the NOVA driver s/w is still freeware (at least it was freely downloadable the last time I got a new version, which was too long ago &^). Someone who, like me, frequents the Atari Advantage SIG on Delphi, claimed that vers. 2.60 worked for him and sent it to me, but it doesn't work for me (so I'm inferring that the NVDI FAQ is correct about the version required).

Would someone be kind enough to send me version 2.61 or later of the NOVA VDI or let me know where I can get it (a Web or FTP site, for example)? I believe that all I need is STA_VDI.PRG, but if there are corresponding updates to MENU.PRG and/or EMULATOR.PRG I'll gladly take those, too.

Please reply by mail if possible as I am way behind in reading this newsgroup.

Thanks!

That's not quite the same problem I'm having. Mine isn't just displaying the
top part and not letting me "slide" down to the rest. It's cutting out most
of the top portion. It'll display some partial raw HTML code, then display
the bottom 10-20% correctly. If the part it will display is bigger than the
window, it will indeed display a slider, but still won't correctly format
and display the top 80-90%.

According to this definition, it's definitely a display problem, as the
whole HTML file is viewable in a text editor.

> I suspect it *is* all there but CAB
> isn't displaying it. Perhaps it is having problems with one of the
> graphics. Try switching these off temporarily ('Don't show', 'Text

I don't know if this helps, but if I go to the page that won't display
right, then go to another page, then go "Back", it sometimes will display
the whole page. Just never on the first try.

> Also try removing all AUTO folder and ACCs and reinstating
> them one by one to see if they are the cause - something may be
> clashing.

Would a crash like this only exist in Magic and no other OS? I have just
about identical setups with both Magic and Geneva (in fact, I have a lot
more ACC's, CPX's, and AUTO's than in Magic). But Geneva won't present this
problem.

> Or could you be out of memory? Some info about your setup
> might help diagnosis.

My setup is this:

Falcon with Nemesis, usually running at 20MHz.
14Mb RAM
2.3Gb HD divided in 4 partitions. The one I'm using for the Cache has
over 250Mb available.
I haven't had any memory problems running CAB, Newsie, aICQ, and aMail
all at the same time, so Memory shouldn't be a problem when just running
CAB.

If it helps, this problem began presenting itself after re-installing Magic. I've tried to re-reinstall it, and it hasn't changed the problem. I'm beginning to think more and more that it's a Magic related issue. Any ideas for what I can change in Magic that would help?

Source record: 47829

There have been a lot of posts on this subject lately, most of which seem to revolve around persuading someone write and update or patch for CAB as the original author has abandoned it, I guess that his is because so many people out there use it.
Personally I like the all in one (E-Mail/News/Web) look of Wensuit, although as I do not have room for a modem, as with CAB I have not tried using it online which I gather is a source of many problems, though offline it works really well, however I digress.

Due to the aforementioned modem problem I'm not really into this at the moment and I have a poor memory so forgive me if I am stating something that has already been mentioned but has anyone looked at a browser called "Light of Adamas" which is the Browser part of Draconis.
I mention it as I stumbled across it while surfing the web, from what I can see it is HTML3.2 compatiable and also implements some HTML 4 commands as well as being JavaScript and Frame compatable.
So if your looing for an Atari equivalent of Netscape Navigator/IE4 for the Atari this could be it.

If you would like to check it out then try looking at...
http://dc2.uni-bielefeld.de/atari/draconis/edownl.htm (English) or
http://dc2.uni-bielefeld.de/atari/draconis/downl.htm (Deutsch (German))
or if your germans good try the Draconis web site at...
http://www.draconis-pro.de/

An interesting and accurate perspective.

Arguably the music side of the business need niche marketing not mass marketing. It can be argued that the Tramiels biggest cock-up was failing to seperate the European (ST/TT/Falcon) and American (game license) businesses.

When in 1993 the German base of Atari Europe was effectively shut down by Sunnyvale to cut costs for the launch of the Jaguar, this effectively killed the Falcon or at least halted its further development.

There is little doubt that if a proper separation had occurred that there would still be a company making very decent machines to run music and other software on - whether they'd be running a gemmified linux, magic, mint ... whatever

From what I can tell, whilst some people in Atari had a clue, the top management certainly did not, and didn't really deserve the decent designers and developers working for them... hence the slippery slope towards releasing games like Kasumi Ninja!

> I bought my first Falcon only in January this year!
>
> Lyndon Amsdon

Me too, in the last 5 months I have only just got hold of a MSTE, TT and Falcon (plus a number of STEs and FMs) before that I only had an STE and FM.

In the last 1 month I have also spent more money on Atari software than on any software in the last 8 years.

5 Months ago I knew nothing of Magic, CAB, Sting, Papyrus, Aniplay, etc, etc, etc

For some reason I just stopped using the machine and moved to other stuff for some time, I can't remember why I had lots of projects on the go at the time.

The last big thing I remember doing (8 years ago) was a Dune clone for the STE (STune I think), we had a map and sprite editor for it, 4 channel mixer for sample FX (not MOD, single sample rate of 12.5 I think), a really crappie pathfinding routine (basically it did not work, tanks would just stop every now and then). We also had the main engine which would display and scroll maps, mouse routine, rasters for the control pannel at the bottom and removed top/bottom boarder it would also play background chip music, the mixer and path finder had not been added and there was no AI (we planed to make it 2 player on 2 STs). We also had a title screen, it was really a demo I was doing that we thought we could adapt, it used the Blitter but played chip music as we thought we could have it run on any ST as long as it had a Blitter (i.e. Megas and upgraded FMs), the sample stuff could be turned off in the game (although we did have a few MOD songs for it which were for high score and credit screens), I was about to buy MusicMon to do more chip music (but had no money).

Today things are more exciting but I am finding it hard to get back into the program as so much has changed since then.

Mark.

This not junk, it's the PPP negotiation :-)
Your ISP do not use anymore the "script" part and you need to use PAP
username and password (read the doc for exact name of the variable) in
your default.cfg or *.scr file.

> Mark.

Really? Do tell. What brought you here?

I found the Atari ST in late 1998, the Jag in early 1999. I was basically an Atari 8-bit user from 1984-1989, picked up a Macintosh Plus (thinking Atari had all but died in the states) and found out nine years later what Atari had done in my absence. :)

Never even REMOTELY heard of a TT, Falcon, MegaSTE, etc... it was a pleasant surprise!

Ditto on that Andy. :)

The TT continues to impress me. Sometimes wish I had not sold mine, but
then I wouldn't have Battlesphere now. :)

Falcons look cool, seem cool for the end user. TT seems fun for those that
want a machine with some expanding room.

And I would still love to see a TT in TT-HIGH mode. That sounds cool.

Hello ATARI fans,

recently I made a little mistake. I told you that there is a Panther card where you can use two ISA cards in your ATARI ST/STE/MST/MSTE, e.g. a networking card and a graphics card. In my first posting I told you that you have to have a PAK to use the Panther expansion. Well that's not true. =8-) You can even use the Panther card without having a PAK. To put it in other words. With the Panther expansion you can even use a NE2000 networking card with a standard 1040STF. :-)

Regards,

Frank

4707. Re: Java enabled Browsers at last?

I must admit that Adamas does render pictures far better than CAB in 16 colours and I think it is quicker too, however I am unable to get the demo working on my TT (just crashes) to test higher colours.

The demo also has a lot of the features disabled but I think one should also note that Java Script is not the same as Java Applets which I believe is what we lack (correct me if I am wrong).

If the suite will also work with Sting then that would also make it much better when working with networks, etc.

Mark.

Hi all,

ACSpro (http://acspro.atari.org) stands for "Application
Construction Set professional".

It's a, visual, user-friendly, application construction
set, coming from Germany (English version is available). It
works on all Atari systems, including clones and emulators.
Supported languages are GCC, Pure C, Lattice C, Turbo C and
Pure Pascal. Lots of examples are supplied as well as
libraries for Pure C and Pure Pascal.

It's now possible to register your copy via
Europe Shareware (http://www.europe-shareware.org).

Bye,
P. Ricard (ES)

It looks like you have a PPP connect, and will need to set up
PAP, or Password Authentication Procedure.

I use STiNG, which I hope has the same abilities. If so, look for a
dialer script file, DIAL.SCR for me, which lets you do that.

Usually it is user name and password (message numbers 8 and 15) but
Southwestern Bell may have a slightly different idea, such as
e-mail address and password.

And I would guess that STICK II generates a log file. It may be
in ASCII, which takes a while, but it is a lot easier that trying
to read what looks like an extended insult. It is probably a message
nember and contents in ASCII. Look at that log file, and an ASCII
table. Worked for me. Was sold, have new address, and did that
to get things sorted out.

Good luck

Personally I dislike the all-in-one approach. I don't want to
launch a heavy prg just to read my mail or News. Furthermore on
the Atari we do have very good mailers/readers such as Okami
and ASH mailer so why invent the wheel again? All the effort
should go to a up-to-date browser. That's what we need most.

I did.

>I mention it as I stumbled across it while surfing the web, from what I can
>see it is HTML3.2 compatiable and also implements some HTML 4 commands as
>well as being JavaScript and Frame compatable.

One big joke. It's the lousiest browser I ever have seen in my
life. It's very strong in crashing but that's all. Javascript,
forget that. Even a very basic script is able to bring down the
browser and if you're out of luck the whole system too.
It's certainly not faster then Cab. Loading fresh pages (not in
cache) happens way faster in Cab then in Adamas. Adamas seems
however a little faster when the pages are loaded from the cache
but I must say most of the time one is even unable to load
something from cache because somehow the cache gets corrupted.
Things which looks great in Cab, MIE and Netscape looks just
awfull in Adamas.
Mind you I'm not only one who's having big problems with Adamas.

The worst thing about LoA is that is commercial. IMHO it even
doesn't deserve the name betaversion, it's more an alfa version.

STinG (and STiK) will indeed do very well. Fill in all the fields that you
can, leave the section labelled "dial script" at the end of DIAL.SCR blank
(but don't remove the line from the script).

>
>I've never taken apart a Mega ST or Mega STE keyboard before.

The usual cause is either dirty contacts due to something spilled
on the keyboard, or just dust perhaps, or perished/broken rubber
key cups. If the Megas are like ordinary STs, then the key contacts
are small carbon blocks mounted on a flexible silicon 'rubber' cup
under the key. This often breaks and makes bad contacts.

Opening up the keyboard is not difficult but it does involve a
lot of very small screws. When you take the bottom off, some key
cups will stay on the keys, others on the keyboard or fall out -
so be careful! Note that one key (I think Return) looks like it
should have 2 cups but only has one.

You can buy good key cups from Best Electronics in California,
perhpas also from Atari WOrkshop.

I will give the first person to help me with these codes a complete, boxed crown of creation 3d game for the Falcon, free shipping, anywhere in the world!

I need the code to Grandads Quest 1 for the Atari ST!!! I miss playing this game and showing it to friends!

The guy who programmed the game and sold the shareware codes is not possible to contact. I registered both Grandads Quest 1 and 2 years ago, and sent him the money over in the UK. Years later I still have the dark red code sheet for Grandad 2, but I lost the VERY SIMPLE single, universal 6 digit code for Grandad 1. All I had to do was write it down, I am such a schmuck! Would someone please put me out of my misery and send it to me!

Secondly, I have wanted to play "Spice" (Defender 2000 type game 1996) for the Atari Falcon since it came out. Once again, the programmer is impossible to contact, I tried for months, and the guy who took over a lot of the Atari shareware, Denesh Bhabuta, can not seem to find the code or a full copy. If someone could send me a full copy of this game, or the code to unlock the demo, it would be great.

Anyone who helps me with both of these problems gets the rare 1998 game "Crown of Creation 3D" (like Battlesphere sort of) for the Atari Falcon 030, boxed and mint condition! (I am not that big on space sim games, though I hear this is the best!), plus a mystery bonus Jag cart!

See ya! -Satcom2

Nice to hear that !

I know a music teacher in Holland who has 30 ST's in his
classroom since a long time and all the pupils do music
exercices on them. The pupils find them strange computers.A
pupil even asked if those computers came from the former DDR. After
a while they like working on them, it's always quiet during the
lesson, you only hear the ST's :-)

I think I'll stick to the former.
In the end, the only thing you see is the GUI. So anything else must be
somewhere underneath. Also considering the saying: X runs on top of Y.
:-)

Bugfix when searching for installed applications: Now the path
will be taken into account as well. If several programs with the
same name exist on the hard disk (say different program versions)
and if these have also been installed several times, then the
"correct" program settings will be chosen, depending on which of
the programs one starts.
If no program with an exactly matching path is found, then
settings of the first installed program (with matching name)
will be used as previously.

The presence of MagiC objects is no longer established by checking
for MagiC being present but via the system function "appl_getinfo".
Under newer N.AESs one should therefore now use MagiC objects
rather than one's own Userdef objects.

> interpreter)?
>
> Used to have Personal Pascal but this wasn't upto much. Need something
> that has GEM Libraries etc.

Sure, Pure Pascal. It's compatible with Turbo Pascal 7 and supported by some GEM libs. Should be available via ASH. A good GEM lib is ObjectGEM which is also used in Texel.

>
> Or even a Modula-2 compiler??

There's Megamax Modula II. It's freeware but is unsupported for a while - I don't know if there is a modern GEM library which supports MM2.

For links just have a look at the UTD list:

4732. Atari Text version of NetHack 3.31?

Newsgroup: comp.sys.atari.st
Date: 2001-04-12 00:21:11 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <9b2s7j$ef3$1@nnrp2.phx.gblx.net>
Source record: 47764
Cross-posted to: comp.sys.atari.st,maus.computer.atari.spiele,rec.games.roguelike.nethack

Is there an official text version of NetHack 3.31 for the Atari anymore?

I remember back a few years ago they had a 16 color text binary, and a separate GEM binary both for the Ataris, now all they have as the GEM version, which you can disable the graphics on, but then everything is in black and white only, with a white background (ugh!). I really prefer the 16 color text mode (with a black background!) of all the methods of playing NetHack. If anyone can tell me where to get a color test version of 3.31 or even how to "hack" the GEM version in such a way as to get 16 color text I would appreciate it! -Satcom2

That's right, I did! <grin>

GG> I really kinda wish I had gone to college in England
> like I was planning on.

I went to college in England and Wales, and university in Wales. Perhaps I'll eventually get to study over here in the U.S.

I used to hang out at a really impressive multi-node BBS that was near Bristol (in England). They had a few lines and the Atari machines running the BBS software were all networked together. It had a really excellent collection of conferences, and Atari networks like NeST and Atari-Net.

Source record: 47765

The problem you're describing is not uncommon with the MegaSTe and TT030 keyboards (they're actually identical except for the color). They're completely different than the earlier Mega keyboards.

The problem is usually caused by deterioration of the contacts or traces on the mylar circuit board in the keyboard. Replacing the original poor quality mylar with a better quality replacement is the normal "fix". I still have several of the replacement mylar circuit boards in stock -- they're the same ones that Best Electronics sells. I'm selling them for $29 with Priority Mail shipping within the continental U.S. INCLUDED.

Taking apart the keyboard isn't difficult, remove all the screws in the bottom of the case to separate the halves, then CAREFULLY release ALL the plastic snap tabs on the interior to get to the mylar circuit board.

Others in the newsgroup have already described the "fix" for the MegaST keyboard.

Reply in Email for ordering instructions if interested.

Sheldon

From the demo, I don't think it's very quick, at least as far as formatting more complex page structures. I do wish CAB had Adamas' picture dithering instead of the one it has.

> If the suite will also work with Sting then that would also make it much
> better when working with networks, etc.

It works somewhat with Sting's Draconis emulator, but not perfectly. If there are any dropped packets, it doesn't check again, putting into a dead-end loop until you hit stop. Other than that, it seems to work. Perhaps if the author of the emulator could put in a routine that would resend commands if there are any problems like this? Or maybe the solution could be accomplished from the Adamas author side? I'd like to see a much faster table formatting routine as well, as it can take almost a minute to display a heavily tabled page that would take CAB seconds to display.

Actually, I was using fiber at my school. But now I use coax, so I would only want a card with an AUI so I could switch between them. If it only had the TP, I never would buy it. I'd say AUI is the way to go since it allows for the most possibilities.

>Atari this could be it.

Adamas is alright. Bu for some reason I seem to remember seeing some
mention of a Mozilla port to Atari. I thought I read that somewone
was goind to recompile netscape to run under MiNTNet and use the newly
released X server for GEM. I would imagine it would be slower than
slow, but at least it could be promising. Was there any truth to
this, or was it just an idea someone had.

Just wanted to know if someone was working on this. I'd like to see
some good news in the Atari browser market instead of all the bad news
annd dissappointments. Can't rely on CAB since development stopped,
OXO said they wouldn't release WenSuite 4 in english since everyone
here gave them such a hard time, and Draconis has also stopped
development (I would assume since MUCS left the market?). The atari
really needs something and I haven't seen any news about Highwire.

So Mozilla? Just wondering....

No, Draconis is still there. But many programmers put extra work in a 2.0
release since it's an important version number. I don't know when it will be
released, though.

It will be slow on stock machines but fast ones should be OK (ish). The
main problem is that the current Netscape is huge, 100Mb or so, memory is
probably the main requirement.

> Just wanted to know if someone was working on this. I'd like to see

Does WenSuite have a browser? is it any good?

Does the Amiga platform not have a Java browser that could easily be ported?

4749. Re: Need NOVA VDI 2.61 or later

Hi Nicholas,

>Would someone be kind enough to send me version 2.61 or later of
>the NOVA VDI or let me know where I can get it (a Web or FTP site,
>for example)? I believe that all I need is STA_VDI.PRG, but if
>there are corresponding updates to MENU.PRG and/or EMULATOR.PRG
>I'll gladly take those, too.
For each type of Nova Card there are specific drivers needed i.e Mach32,
Mach64 and the Nova Falcon drivers. So please specify what you need (card
+ computer+interface) and I'll mail them over.
BTW the latest version of the drivers is 2.67
Since version 2.52 the whole package has been updated considerable, so
you need the full installation... anyone else interested in these, just
yell :-)

>Would someone be kind enough to send me version 2.61 or later of
>the NOVA VDI or let me know where I can get it (a Web or FTP site,
>for example)?
Although the drivers are free of charge they don't have a freeware or
shareware status, they are not supposed to be on a web or ftp server,
I've been trying to convince Gerhard Huber (the programmer) to release
them as freeware, but he's not really enthousiastic.... just yet ;-)

Cheers from Belgium
Dennis

Date: 2001-04-12 11:48:20 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <987092228-58199AEicMi@gmx.net>
Source record: 47790

From: "Mark" <mark@recycledsteel.co.uk>
Date: Tue, 10 Apr 2001 12:24:32 +0100

Hi Mark,

>Any thoughts would be good.
I know absolutely nothing about the Crazy Dots card but here's some info on
the programs in your AUTO folder...

>WDIALOG.PRG - Don't know
Part of NVDI, needs to be active unless you've got MagiC 6.0 running. The
best place for this program is at the bottom of your Auto folder.

>DMIRROR.PRX - Don't know
Part of The Edge, not really recommended, get rid of it...

>MFP_TT.PRG - Part of the repalcement port routines of HSModem
>SCC.PRG - Part of the repalcement port routines of HSModem
On a TT, supposing you're using modem 2 or serial 2, you only need SCC.PRG.
The MFP_TT.PRG is for the "slow" ports, get rid of it...
SCC.PRG should be as far down in the Auto folder as possible...

>SOCKETS.PRG - Something to do with IP but not sure what program it
>relates to
This is part of IConnect, needed when you use CAB with the ASH OVL or some of
the ASH internet clients.

>TRAPPER.PRG - I think it is used for Magic but not sure what it does
Part of Jinnee, should always be active when Jinnee is running.

>MAGICSND.PRG - Magic sound related file, not sure what it actually does
Not needed on a "real Atari", get rid of it....

>SLCT_DEV.PRG - NVDI program to select resolutions
Like I said, I know nothing about the Crazy Dots card, but it seems to me
that this program should be much higher in your Auto folder, the Nova cards
have something similar and this needs to be run *before* NVDI and Magxboot.

>KOBOLD_2.ACC - Copy prgoram that appears to have stopped working
Rename the ACC extension to PRG, and see what happens....

Cheers from Belgium

4751. YUPPIE Atari-ST font needed on Mac or Windows

Newsgroup: comp.sys.atari.st
Date: 2001-04-12 12:22:43 UTC
From: Andreas Krause <nospamAndreas.Krause@philips.com>
Message-ID: <3AD59E13.A9BA43D4@philips.com>
Source record: 47783
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,

I need to get the YUPPIE font, which is known on the Atari-ST platform,
on either Mac or Windows. Does anyone know where to look or how to do
it. I have it only on my Atari box, but have no idea how to use it on
Mac/Windows.

Rgds,

Andreas

Note: remove the 'nospam' prefix, when answering!

On a TT running Linux it takes Mozilla about ten minutes to start up.
And after that it is *extremely* slow. Ataris (even the clones) are
simply much too slow for Mozilla. Just install Linux on your machine and
see for yourself.

I can't recall hearing about Highware, but then my brain went to sleep a few
of weeks ago and I'm just running on autopilot (mmm, better look out for
Chinese war planes), curios about Highwire I did a quick search, for info
try
http://www.magical-sides.de/h_high.htm

I think it's a shame that it probably wont run in single TOS as it could
prevent some people from being able to what could be a very good browser.

Hahaha.. that is cool! So what is it about an Atari that makes it seem to soar in the midi field and what software should I pick up should I decide to try the midi side of the ST? I have a 1040ST and a Mega ST/2 right now.

Until only about 4 years ago my school had about 5 STs running Pro 12
and Quartet. Most broken now as they fell off a shelf, all piled on
top of each other. School uses about 30 Acorns running Sibelius 6 and
Notate. The ST's didn't have HD's so they weren't that good.

4761. amail

Newsgroup: comp.sys.atari.st
Date: 2001-04-12 16:39:32 UTC
From: Milton Horst <milton.a.horst@boeing.com>
Message-ID: <3AD5DA44.2FD0BDC4@boeing.com>
Source record: 47794

I'm having trouble getting amail to work.
It downloads the mail messages from the ISP OK and puts them into
a file on u:\tmp, but then fails when it tries to import them into
the inbox. The program and all its files are on a Minix partition,
except the HOME directory, which is on C:\. I don't see anything
obviously wrong in the CFG file. Any ideas?
System is a Milan040 running FreeMint 1.15.10b, N_AES 2.0 and Thing.

When I run CAB, the icons on the Thing desktop change to a dark blue color, and don't return to normal after exiting CAB. Is there a solution for this?

Also, how does one kill a program that has "locked up" under Mint/N_AES/Thing? I miss the ctrl-alt-esc function of MagiC that usually could solve these problems when the drop down menus and mouse buttons do nothing but the mouse pointer still moves.

Jo Even made a program calle dTaksbar IIRC and this was like a win 95
style bar and you could terminate programs. Runs best under Mint
which will suit you well.

I've used .961 on my STe with no problems at all, whereas I have problems with STing 1.26, that doesn't even allow the computer to boot up, it just goes into the dreaded loop and I have to reinstall 1.15, STes' definitely have a character all their own!

u:\tmp is a virtual folder on a virtual drive isnt it?, not a physical
device, so unless youre using an alias the file will disappear when a
new one comes along..

I have never had this problem under Magic. If it works well under
Geneva, then there must be a setting in Magic or maybe there is a
program in the START folder that is affecting Cab. Maybe the caches in
Cab need to adjusted.z

>have a character all their own!

I used to have a problem too with Sting 1.26. I recently tried it and
it worked fine! Only thing I changed was my HD and it was locking up
when I accessed the HD. I'll put the blame on the IDEal interface :)

>look for in the SRAM chips? Thanks.

OK here we go.

It's three surface mounted chips near the keyboard connector.
Identical to each other. Mine are AC7C256-25C. You need to find the
last bit, mine being the 25. This is the nanoseconds speed. You do
1000 divided by this at it tells you the speed that the manufacteur
wanted it to go at. Mine are 40Mhz rated but run fine at 50Mhz.

Yes, that does happen. Sometimes that can be fixed by adjusting the
vertical hold. I have fixed the problem by using a video convertor.
Sometimes it works and sometimes it does not.

: would appreciate it! -Satcom2

No, the official Binary in tty-mode comes with colors.
Maybe your TERM Env-Variable is wrong.
Try TERM=builtin.
Or you have disabled colors with the options.
If that didn't work tell us about your setup
(Hard-/Software etc.)

Same problem here. Yellow changes to black. The only solution I know of is opening the Color Setup CPX and clicking the "Reload" button. This reinstates the system's colour palette.

>Also, how does one kill a program that has "locked up" under

4775. [ANN] ERS now available via Europe Shareware.

Newsgroup: comp.sys.atari.st
Date: 2001-04-12 23:00:51 UTC
From: Pascal Ricard <paricard@free.fr>
Message-ID: <3ad641141589dc1@free.fr>
Source record: 47721

Hi all,

Eric Reboux softwares (ERS http://ers.free.fr) are now available via
Europe Shareware. The first program to join the list is WinFrame. It's a
new windframe for Magic (6 and up).

Excerpt (from the readme file):

1/ What is windframe?

Windframe is a small program that's utilised by MagiC for displaying
windows to make it possible to personalise the graphic interface. The MagiC
6 windframe is a MAC OS imitation, which also makes it possible to alter
the looks of the buttons of a RSC file. To radically change the windows,
all that "needs" to be done is to rewrite windframe completely. That's what
I've done, and it took me quite some time ;-)

2/ What exactly is offered by windframe?

-It supports 3D, textures and gradient colours. All these features combined
offers a MagiC user more pleasing effects and functionality than the latest
window-managers of other systems.
-The window/program title is "put" just behind the closer button.
-It's compatible with the Xgem system and Direct desktop.

[end of quote]

Coming soon: Find It, Direct (a new desktop).

Bye,
P. Ricard (ES)

The standard Milan setup includes a taskbar called Multistrip.
It has popup menus that let you terminate a running task.
Trouble is, in the lockup situation I tried to describe, I can't
get the popup menu to "pop up".

A CT2 in a Falcon is essentially a TT. Mine has 64 meg fast ram and 14meg chip, CT2 gives a 50Mhz core. All housed in a Full tower. Pretty funky, I will probably pick up a TT next week, just to top the collection off. By the way a Falcon can be pushed upto 1280x960 just using software and a good monitor;-)

No problem, I have 4.1 running at the moment but will reinstall XaAES today,
incedently, is there a good freeware desktop around that willl allow res
changes on a Falcon.I still love TOS, so 4.1 is nice if a little slow.

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.marketplace
Body handling: HTML body converted to readable text

FREE!!! If your looking for free Atari Catalogs, read on down below!!!

I have some semi-FREE Atari stuff. If your local to me (Portland, Oregon USA) Your welcome to come pick it up for FREE! Dan Vernon, this offer is also extended to you. If your not local to me, you'll need to pay me to ship it to you. Besides paying for Shipping, a bribe will be expected or it isn't worth my trouble. You could also make a purchase from my Atari Catalogs which would motivate me. If you have someone local to me who can come pick it up for you? I would appreciate it. And while your here you might buy something. FREE stuff I have? 520STs, the first ST computers without built-in floppies. A big box of 3.5" Disks you can use! Atari 800 Computers. 8 Bit Drives & HardWare. E-Mail or Call Ben@(503)256-9974!

e-mail: atari@benjamin.net

I've just added 6 boxes of Atari ST Software, including some choice Games. So please checkout my Catalogs as they Grow! Not just ST Software! And I'm offering a 20% Discount to my regular customers! E-Mail me for Details on Redeeming this offer! I'd like to say Thank You for letting Bravo Sierra Computers Support you and your Atari Needs. Haven't bought from Bravo yet? Give Ben a Chance! I can be quite Beneficial. Remember, if you can't come see me today? Come see me tomorrow! Call Ben anytime at (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. My customers love the speedy service! I also have lots of Atari Reference Books. Which I can Mail by Book Rate!

I've switched ISP's! Try www.pacifier.com/~atari or atari@pacifier.com and as always www.atari.benjamin.net and atari@benjamin.net still work but are being redirected to my new ISP and since I've moved, I have revamped and updated my WebSite and all my WebPages. So Check it out and, If you don't come see me today, come see me Tomorrow!

Click for WebSite!

FREE Catalogs for Classic Atari 8 Bit, Atari ST Computers & Atari 64 Bit Jaguar Game Machines!! HardWare, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net while you Download Free Catalogs directly from my site. If you can't get my Catalogs that way, Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify Atari 8 Bit, Atari ST and/or Atari Jaguar! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can

download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your full Mailing address so I can figure Shipping & Handling. I'll be back after the weekend. Bye!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or atari@pacifier.com instead of NewsGroups as I am swamped and I find it hard to keep up with reading the NewsGroups.

I update my catalogs once a week. Just before this message is posted. So when you see a new posting, check my Catalogs. After I post this message. I'm off for the weekend. But I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or atari@pacifier.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Bravo Sierra Computers has Moved! To a New ISP! Now Hosted on pacifier.com!!! Atari 8 Bit, ST and Jaguar Hardware/Accessories, Software/Games & References/ Books. FREE Catalogs on the web at http://www.pacifier.com/~atari or at Ben's SubDomain at http://www.atari.benjamin.net Catalogs Requested by and Received Through E-Mail at atari@pacifier.com or atari@benjamin.net and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hi Ed,
Are you going from PAL to NTSC? If so, which one are you using and where did you get it (cost?, video or RF in?). I'm looking to get one (someday) for my UK Falcon MKI which is PAL/RF out. I've seen them in J&R Music world (I believe) but in the $200 - $300 price range and the NTSC to PAL was only around $50.

Phantomm,
My "poor man's" solution is to pop off the key caps. The larger ones
I'd leave alone though (wire hinges). While depressing the buttons, place
a drop or two of alcohol in the center, release, press, etc. If it's
dirt that should help. Also, a cleaner with a lubricant will last longer.
Once you've done your best, get Safe Skin for the keyboards and if by
chance you are severely lucky to find Safe Skin for the Mega board, buy
two and send one to me. I'll pay you for it! (:->)~

> do as an alternative. I'm also interested in a general purpose SysEx patch
> librarian, as well as specific librarian/editors for the Korg Wavestation
and
> Emu Proteus 1.

Decent sequencers with features:
- MasterTracks Pro (available free today; you should find a link on
http://sites.netscape.net/timconrardy/timidi.htm),
- Cubase (http://atari.georezo.net/music/cubase/ - a French site; I can't
find a British one, sorry...),
- Notator (http://www.crosswinds.net/~notator/ - Notator / Creator related
site; Notator is still to be purchased as far as I can know).
If you wish to have more MIDI ins / outs, Steinberg's Midex+ or SMP-24
provide it (2 in / 4 out) together with SMPTE synchronization.
Universal ed/lib: Midi Quest (http://www.squest.com/Atari/), probably the
best still available.
A Proteus1 dedicated editor should be somewhere on my disks; I can send it
to you as well as some other goodies if you wish (mail me).

Regards,
Andy

I know that when I was editing the script for STIK II last night that the usual "#" was actually a british pound sign. After hitting key combinations in Edith, I was able to pull up (with cntl-f6) a ASCII table of various characters. I manually clicked on the "#" in that table and managed to get the job done that way.

Still learning about MagicMac (and STIK) myself. :)

Last night I removed the FIND/RESP part of the script (by placing the "#"
remarks in from of the commands) which found the setup crashing. :) However
still plugging and determined to make my ST once again my internet/E-mail
machine.

Hmm, my Falcon's running at 1024*704 but only in 16 colours until I get
the CT60. I'm using my Microvitec monitor that can do ST low res so
it's quite nice for playing demos etc. It isn't supposed to go to
this resolution as it's quite a white border on the right where the
screen rolls back on it's self! Centscreen is the best I think.

4795. FA: Dungeon Master + Chaos Strikes Back for Atari ST

Newsgroup: comp.sys.atari.st
Date: 2001-04-13 14:24:02 UTC
From: Retrogamer <ka001a5509@blueyonder.co.uk>
Message-ID: <6_DB6.14799$4S3.6039769@news2.cableinet.net>
Source record: 47729

Hi,
Please check out my auction for Dungeon Master + Chaos Strikes Back for the Atari ST computer.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1229407411

Dungeon Master is one of the most legendary ST games there is. The adventure takes place in a mysterious underground dungeon that is to be explored. "Every twist and turn, every nook and every corner looks real." You switch between the roles of four adventurers collecting varied weapons, keys and treasure while avoiding the monsters!

The game is boxed and in great condition. You get the disk, keyboard controls sheet and full manual. Also included in this auction is the sequel Chaos Strikes Back. For this one you get the manual, game disk and utility disk

Thanks,

Keith

Thanks John and to everyone who has posted and e-mailed solutions for the keyboard problems. If I find a exta Safe Skin then I'll pick one up for you. :)

I'd still like to find a do it yourself text file or diagram for connecting a Mega ST or Mega STE keyboard to a Falcons motherboard. I'd like to fix it were I can just plug in the keyboard just like on a normal Mega ST or Mega STE.

I believe that some of the Aftermarket Cases for the Falcon have a similar connection for keyboards.

Has anyone done such a project and have info on how to do this correctly?

>Same problem here. Yellow changes to black. The only solution I know of is
>opening the Color Setup CPX and clicking the "Reload" button. This
>reinstates the system's colour palette.

No the above isn't normal. On my system the desktop colors doesn't change
when I load Cab. There are programs such as Looknsee which change the
colors but they all, except 1stguide, quits nice No messing around with
the colors. As said just 1stguide behave bad
Are you using a background picture and if so uses that picture the system
color palet?
A much shorter solution is just hit [control]+[shift]+L. This command will
reload the current Thing setup, at least that's is so in Thing 1.27b.

hth,
Martin

I had lots of problems with Newsie & the SCSI on the Falcon. Kept getting file corruption (Shiumig Lai? mentioned he'd had similar problems). The SCSI packed up and has been replaced with an IDE drive. No problems with this so far, fingers crossed. Uwe Seimet mentions problems when using SCSI & screen expanders. Again the IDE now gives compatibilty with Screenblaster. Don't know if this is relevant to your system.

4803. Everest clipboard

Newsgroup: comp.sys.atari.st
Date: 2001-04-13 20:01:30 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <9b7luqfqe1@plutonium.compulink.co.uk>
Source record: 47739

To add to the discussion some months back about the Everest clipboard. I have 'GEM Clipboard On' activated, but I find that (at least sometimes - perhaps mostly) Everest doesn't save text copied with ^C to the CLIPBRD folder on C:\, but to a CLIPBRD folder in E:\1WORD_PL.US\ which it will create if I delete the existing one. Even stranger: Trying to overcome this, I edited the 1st Word Plus program binary to change the scrap folder to CLIP1WP. Word Plus created and used it quite happily, but so did Everest! Even when I deleted the CLIP1WP folder in E:\1WORD_PL.US\, Everest recreated it! Somehow it seems to be picking up the path and folder name from Word Plus - but how? In MAGX.INF I have:
#_SCP C:\CLIPBRD\ as well as
#_ENV CLIPBRD=C:\CLIPBRD\ and also
#_ENV SCRAP=C:\CLIPBRD\

but for some reason Everest ignores this. Any ideas?

Another thing: I have noticed that occasionally Everest won't accept the [Alt]-ASCII combination for producing higher ASCII characters such as Umlauts. *Mostly* it is OK, but somethimes nothing appears in the dialog, though it will appear in the text itself immediately after. Reloading Everest usually cures it. Again - any ideas?

Regards, /Peter/

Someone may already be working on it, there is a competition going that will be finishing in a month or so, which is to do a big port from another platform to the Atari. One of the suggestions was Freeciv, and as a big fan of Civilization I'm hoping that someone has been working on it.

See http://www.magical-sides.de for more info (follow the BIG Competition link).

Cheers!

James

Unfortunately the message ID numbers are set by each ISP, and are not
unique. ie, they are different on different ISPs.

So a newsreader like Newsie looks at the subject line, (but also looks at
the date of the original message I think) and groups messages together.
However if you change the subject, then Newsie thinks you are starting a
new thread and doesn't group the new message with previous ones.

Cheers!

James

Iggy, nope I'm not. It's not slower, perhaps not less usefull. My
point (and some others) is that one is forced to get/buy/find more
hardware to get it running. Like the Milan-060 example, any buyer
would immediately need to get a diskdrive replacement.
In my case (I'm sure there's plenty of others) I would need to get a
media converter to get from AUI to UTP/STP.
Heck, I'm not even considering BNC as a possible solution.
This is 2001, you know?

4812. More Atari nostalgia

Newsgroup: comp.sys.atari.st
Date: 2001-04-13 22:55:59 UTC
From: tcjspencer@zetnet.co.uk
Message-ID: <3ad783ff$0$8832@news.zetnet.co.uk>
Source record: 47745

I've just found a copy of Which Computer? for October 1989 in which there was an item on Best Buys 386 desktop computers, the Budget Best buy? the Atari 386. I quote:

"....The main appeal of this machine is that at 2,599GBP for a complete VGA system (less monitor) it is remarkably cheap"

There's an interesting report on the technical specification, a colour picture and an item headed "Company Details".

Also a report/picture on the Atari portfolio and finally a full colour advert, including pictures, for Silica Shop Limited and headed "Atari ST Computers":

520ST-FM Explorer pack 299 GBP plus SM124 mono monitor 398GBP
colour 598
520ST-FM Super Pack 399 mono 498
colour 698
1040ST-FM Professional
Pack 499 mono 598
colour 798
2Mb Mega ST 899 mono 998
colour 1198
4Mb Mega ST 1199 mono 1298
colour 1498

No hard drives of course just "1Mbyte built in disk drive".

Exactly my point and well-stated, Louis, thank you.

To Jeff, Iggy and Mario hiself:

I do not deny the versatility of an AUI interface; I only doubt
its usefullness in a real-life situation where a quick, painless
integration with other _contemporary_ computers is needed.

I do not know of such a desktop. On my Milan/N.Aes I must run CHres.prg and this will
do a reset anyhow. The nature of the Atari screen handling doesnt allow to
change resolution without reset. On my TT with NOVA, I just activate menu.prg
which runs in the autofolder, before the VDI is initialized.

No it was a mint problem, I think. I suspect that the original release of MultiTOS couldn't cope with the TT ram and just screwed itself. I replaced the Mint kernel with 1.15.5 and all is well. Altho with beta 10 it just locks the system up. The more I use it the more I like it.

1280x960 is possible but a bit flickery in 16 colours. Fine in 2 colours,
which is TT high.

Remember 1.15.10 starts up by default in MP. Changing the name of the
kernel won't help you. Just push the [shift] key at boot time. When MiNT
loads you'll get some kind of set up menu in which you can deside to use
MP or no.

MiNT is surely a great system.

Nope, only the bad newsreaders are acting so. A good reader doesn't rely on the ISP but sets the ID self. That bad behaviour of Newsie has been reported years ago (early 1997) but alas ...

Relying on the ISP to set the ID is bad because there are no laws or whatever who says that the ISP must set a proper ID. The most ISP's will provide you with a proper ID but some don't and then ....

The same story for the Date. Relying on the ISP to set the Date as Newsie do -at least this was so with earlier version, I don't know how the current version acts as I don't use it- is very bad.

Hmm out of the 4Mb Mega ST and 38, I think I know which one I'd
prefer. I can't see what the attraction of a 386 is when you see that
it's twice as expensive. In an old Electronics World 1989 it had a
competition to win a Portfolio. Says "Worth over 200 pounds". Quite
expensive compared to that 520 STFM.

Two SM124 monitors - $15.00 each
Two SF314 disk drives - $10.00 each

Any offer will be considered.

These are spare parts I am not using. All are in very good cosmetic condition and work fine. I have ATARI boxes for each.

Terms: United States addresses only. Buyer pays shipping. Full payment prior to shipping. No COD's.

Please reply to: gwestndrf@aol.com

Hi

>That's is one of the few bad things of Newsie. If you really want a
>good Atari reader go for Okami or ASH mailer.

OK I'll try Okami seeing as I'm setting up the new system. I
currently use Newsie for email and news, but I'd like to get rid of
Newsie altogether. What's the best email client for Stik/Sting layers?

I tried Amail, but I just got annoyed as I'd save a setup and then it
would not remeber it when I next started it. The cfg file was in the
$home directory though. Also I don't like the way it puts all the
mailboxs in home directory. I like to keep this place clutter free.
Any good suggestions?

Hi everyone!

I think I must have a configuration error but I can't work it out. I can go into an FTP site manually and I click on a file and it'll download. But if I use it as the FTP client in CAB it comes up with an error (after logging successfully into the FTP) with "Can't create local file". I've tried going back to default settings and fiddling with the paths but neither help at all. It's very annoying having to go through the directories one by one.

Thanks!

I do not know just why people keep saying this. I agree with you. Right
now I still use my Hades and have a 1040STe right next to it. Once I
get another monitor, my setup will include a 130XE that will be running
using 800XLDJ.

What I am doing is running a Pal program through the converter through a VGA monitor. I bought one of those TV God Boys. The box says they are for Pal TV's. I tried it out on mine and it worked except for the scrolling which I could not get to stop. So I hooked it up to my SVGA monitor using the convertor and it worked fine. I then downloaded some 8-bit pal games/programs. I run them through a SVA monitor using the same converter. About 90% of them were fine. The one program that did not work too well was a game. The Picture scrolled alittle when I used the joystick. The converteris called a VGA-801 and I bought it from a place in Illinois called Matco. The cost was around $85-$90. The url site address is: http://www.mat-co.com/

I have this module and still use it, but I do not have the one with the
Q. Eproms. In fact, I did not know this kind of MT-32 existed. I always
modified the module and then saved the modifcations to a file and use
just reploaded the file when I wanted to. Some gent made a very nice
program to do this. I would try ebay or else ask Roland themselves.

Hi Lyndon

The best emailprog, in my opinion, is MyMail. Try it, and never look
back ;-) Seriously, it's constantly being updated and Erik is working
on it nearly every day. Could be a bit slow on low end machines, but
that's the only major drawback.

This depends on the VDI. If the VDI can switch to another resolution on
the fly, restarting the AES and it's clients is enough, and a reset isn't
necessary.

Interesting. I have Sting, Newsie, and Ghostscript on one drive, SCSI.

Two of those programs do an awful lot of writing, and then erasing,
either automatically or manually, and with that I do stand a chance
of write errors. I got more than I wanted, changed from ICD Pro to
HDDriver as a disk driver, and will see what that does. Do not yet
know if it is mostly due to program, electronics, or drive mech.

Mymail is indeed a good mailer, no doubt about that, but it's just a
mailer. It can't read News (yet).

Furthermore it holds IMHO a very bad shortcoming. The time zone settings
are rather badly implemented.

IMHO, the best choice is Okami. It works with every OS, including
MagiCpc/Mac. Okami doesn't like however Geneva very well.

The mailboxes can be set everywhere you like. Just change the paths. I
suggest you do it yourself. Load amail.cfg into a editor and change the
paths, including the ones of the Custom Box settings.

This should work. It surely works on my system.

:>: diskdrives are available)
:>
:>You all seem to be implying that AUI somehow is a slower and less useful
:>interface, when it in fact is the most flexible one and runs just as
:>quickly as any other 10Mb interface.

: Iggy, nope I'm not. It's not slower, perhaps not less usefull. My
: point (and some others) is that one is forced to get/buy/find more
: hardware to get it running. Like the Milan-060 example, any buyer
: would immediately need to get a diskdrive replacement.

The point here is that nothing needs to be replaced. It's just a matter of
getting an adapter for your kind of network, just like you would need a
cable, a hub or a T piece.

: In my case (I'm sure there's plenty of others) I would need to get a
: media converter to get from AUI to UTP/STP.

That's exactly the idea. Others would need an adapter to BNC, yet other
might like fibre adapters.

: Heck, I'm not even considering BNC as a possible solution.
: This is 2001, you know?

It is, what's your point?

Like I said in the other reply, I don't think I need it. Your using
the German installation of Jinnee right? I'm using the English ones.
That's why I was getting confused over Scripter, as your installation is
differnet to mine.

There is a link on Hallvard's Atari launchpad to exactly such a project:
ftp://ftp.teleport.com/users/atari/megabrd2.zip
Unfortunately, that link seems to be dead, although someone else might
have it locally stored.
Then there's the possibility of wiring a DEC LK*01 keyboard to the Atari.

The Hades is not available in the US. However if you really want
one bad enough, Medusa will ship one to you. That is what
I did last November, and assembled the machine myself.

Milan I can't say. Never bothered to check into it.

Hi

I'm using Magic v6 and Jinnee v2.5.

Anyone have any suggestions to a program that can display common file formats (Gif, Jpeg etc) and play samples (wav avr etc). Must be fast loading and dithering quality isn't too important as long as it does it quickly (faster than Imagecopy doing Floyd Steinberg!)

Also any other utilites that are considered essential or useful. Basically I want it to be very usable (I like the plugins with Jinnee) and a lot of fun to use.

I tried Look'n'see, but I'm looking for something that can just display/play without bringing up a huge window that obstructs half the screen.

Message-ID: <9babqo$sh2$1@geraldo.cc.utexas.edu>
Source record: 47692

Do you know where I can find the Atari ST game "Masters of the Universe" (He-Man)?

I have tried the version in Automation 90, but it contains a bug that prevents me from finishing the game. Additionally, I get the message "Please insert disk one then press return" when I bring up the map screen.

I tried SuperGau 127, but it crashes the emulators at the second title screen.

I would love to find a working copy. I would even be happy with the original ST files so that I could drop them in a mounted hard drive or write them to a disk image with Makedisk.

Failing this, I would like to buy the original 3.5" disk.

It's just a matter of changing your setup.
Go to global settings. In the misc part/Action after wind close:
change it from Connect to next to whatever that suits you best.

And about your other problem, have you set the dir cache?
Setup/Path settings --> enable DIR cache

I'm about to give my Falcon to a friend of mine. His main use is for music (Cubase) and I've set that up. The thing is that I haven't used the Falcon for about 18 months and he wants me to set it up for an internet connection. Mostly that's no problem (see setup below). Using CAB 2.7c and Sting I can connect OK, but when I enter a URL it seems to try to load but I get "Error -#34".

It's been such a long time since I used all this I can't remember what that means. I have a vague recollection it's something to do with the Cab.ovl, but I'm not sure.

I'd be very grateful for some advice.

Setup:

Falcon with 14 megs memory.

CAB V2.7c with Cab.ovl v.1.4400 from Dan Ackerman (whatever happend to Oliver Booklage's ovl ?)

Sting Dialler Version 1.15, STinG Version 1.15 (I know there are newer versions, but what I have seems to work and I'd like to get this up and running with the minimum of changes!).

Thanks in advance ...

Andrew Harvey

I use Look'n'See as one of my CAB viewers, and the only window that comes up is the small formatting progress display (which goes away), and the window with the image in it, which is what you will (hopefully) get with any image viewer. Anyone know if there is a setting that would cause/fix this? Apart from the fact that it turns the screen funky colors, I like this viewer. It has more supported formats than anything else I've seen.

Hi mathieu,

>Oh yeah ! I'm very interested in ! I've got a NOVA card 2Mb (VME format) on
>a TT030. However, I had not seen any problem when I installed NVDI 5.
There are no problems with NVDI 5.0 provided you install the NOVA drivers
first, the NVDI installation program will install a perfect working setup.
Most of the changes involve better compatibility with old programs that don't
work with older versions of the driver... some bugs have been removed as well.

The drivers are in your mailbox now :-)

Cheers from Belgium
Dennis

If D2D is a must, I'd think of something like Yamaha CBX-D3 recording module. It can be found quite cheap second hand today (eBay for instance) and is IMO much better than Cubase Audio, though its several limitations compared to today's standards. However, this could let you get rid off syncing troubles for anything you run is a single piece of software (in this case a special Cubase Audio release is needed). Pros: it's cheap; it's got much better effects than software available for Falcon (two Yamaha's SPX1000 equivalents in fact; still today, compared to some cheaper stand-alone D2D recorders it doesn't sound bad, which is my personal opinion, however...); it's got versatile editing features; provides good interfacing with XLR (analog) and coaxial (digital) in / out sockets (2 analog ins, 4 analog outs plus a pair of digital in / out), and it's capable of running under an Atari ST. Cons: discontinued (so you can only use it with the available software); only 4 tracks; lacks features found present in modern hardware of this sort. Nevertheless, I still find it a good option when a budget matters.

Right. There also used to exist C-Lab related Emagic Logic for Atari (http://www.harmony-central.com/Newp/WNAMM96/Emagic/atari.html), not mentioned above.

> From the screen shots I've seen, Cubase looks good, but 150ukp for

A similar situation existed with lasers, especially at the outset,
from people who just refilled toner cartridges rather than
remanufacturing them. Apart from the cost of the cart itself,
refillers/remanufacturers always put more toner in than the original
had.

What you need to look for is suppliers who guarantee repair of the
printer if the cart is responsible for a failure. All resposnible
re-manufacturers will offer this.

This is not an Everest problem, but an FWP problem.
For some bizarre reason FWP forces the Clipboard to within the folder
that FWP resides in. FWP didn't recognise a system-wide clipboard when
it was written (it probably pre-dated the concept tbh).

The only way around this is to reboot after you use the clipboard
within FWP AFAIK...

What does the "blah blah" bit actually say. I suspect it's saying it
can't run properly so it's defaulting to the basic TT boot mode. I
think this is the first clue as to what's going wrong, not something
you can ignore.

> DRACONLD.PRX - IP stack for Draconis suite of software
> STING.PRG - IP stack for most other programs (CAB, etc)
Not sure about this, but I don't think t's wise to run IConnect's
SOCKETS.PRG if you intend to use STING.

> TRAPPER.PRG - I think it is used for Magic but not sure what it does
> MAGICSND.PRG - Magic sound related file, not sure what it actually does
> SLCT_DEV.PRG - NVDI program to select resolutions
> EXTENDOS.PRG - CDROM drivers
Should Extendos be so late in the boot sequence? (I don't know).
SLCT_DEV should be after all Auto progs.

Thanks for these details, but what drivers are shown in your
ASSIGN.SYS file (no need to list the fonts). Do these driver files
exist in the folder shown in Assign.sys?

You aren't showing a boot manager in your auto folder. Is that right?
If you are, does your bootset overwrite your assign.sys? Obviously,
this is key to the running of Redirect and NVDI.

Also, where in the country do you live, Mark?

I know that this is probably a stupid question, but did the 520STs come with a SCSI or other port with which to connect an external hard drive? Also, what would be a reasonable price for one of these beasties?

Adam.

I have an Seagate Hard Drive loaded with programs to access on my ST.

I need to locate HDX 6.0 to access it. Does anyone know where I can
find it?

Once I get it, how to use it?

I regularly don't use ST computers. Any help would be appreciated.

Thanks,
Glenn Bruner

Still around. The setup is fine for internet. Sounds like the OVL
needs changing, they can cause very strange problems. I don't have a
URL for either Dan or Olivers sites, but if you search I'm sure you'd
pick it up. Does email work? If it does then it certainly is the
OVL. It is either in CABs directory in the same level as the program
or in the modules folder.

I want to use it as a Jinnee ascoitiated application, so that when I'm
on the desktop I can double click on a wav or gif and I'll see/hear it
quickly so I can recognise it. Look'n'see also didn't pop back out of
memory when I finished listening to the WAV. I'll be passing CAB's
demands to the AVserver so that Jinnee can load up the program,
hopefully as this is supposed to be better as it closes down the program
once the process has finnised. I'm not too sure really.

Thanks

It certainly is. Doing my SCSI cabling this easter. I have internal chain then going on to a port on the back for Zip, MiniS and Scanner. Want to see the pictures? Go to http://www.lyndonamsdon.co.uk and click on the bottom link IIRC. There are some flaws in my hand written code that I'll sort out today (like looking for a *.gig file instead of a *.gif!). I was tired doing it at about 1am!

New pictures will be coming up actually, showing blue LEDs and digital thermometer readout (controlling loads of case fans). I'll bung in another floppy drive even though I'll probably not use it.

Bye!

That's AHDI IIRC. Available on many ftp sites, do a search for AHDI.

Installing it is easy, just put it all on floppy and insert in the
floppy drive. Click on the install program and away you go.

There is also an IDE adapter, which will allow you to run the (sometimes)
cheaper IDE drives.
I notice keychange lists these at ?35.00. Not sure what driver you need with
these...

```
Of course these are no use for tape, or other non-disk SCSI peripherals.
(scanners, lasers etc).
Also not sure about CD support (reader? Writer?).

Exactly the same. It is a bitch to get the board in, had to cut out the
bottom 5.25 bay. I can still get a hard drive in there tho. In total, I got
a syquest 88, 2.1 gig uwscsi, 36x ide cdrom, 1.4 gig ide, hard drive cradle,
and a floppy in it. Not to mention the apple cd300 sitting on top of the
box. All the bays are full ;-). Only way to fly.

4902. AtarIRC still giving problems!

Newsgroup: comp.sys.atari.st
Date: 2001-04-15 11:52:32 UTC
From: bindon@madasafish.com
Message-ID: <tdj2s07mq8343a@corp.supernews.com>
Source record: 47637

```
Hi!

Right, I'm still having problems with AtarIRC. Just d/l it again and
same problem. Anyone using this program in the UK? Could you send me
your configuration file? Here is the log file where it goes wrong.
---------------------
Resolving irc.mcs.net
Opening IRC session to irc.mcs.net :6667
AUTH: <irc.mcs.net> *** Looking up your hostname...
AUTH: <irc.mcs.net> *** Checking Ident
AUTH: <irc.mcs.net> *** Couldn't look up your hostname
AUTH: <irc.mcs.net> *** No Ident response
stimpy :Nickname is already in use.
Attempting auto-nick change

<cut the advertising stuff>

End of /MOTD command.
stimpy_ (~nouser@212.38.177.203) has joined #Atari
[stimpy_] hi!
stimpy_ (~nouser@212.38.177.203) has joined #acorn
irc.mcs.net issued a mode change: #acorn +nt
stimpy_ has left #acorn
stimpy_ has left #Atari
Closing IRC session to irc.mcs.net ...
Closing Link: 212.38.177.203 (changing server)
tcp_close(irc.mcs.net)=No error.
--------------------------

I got on with that one OK, but a lot of channels weren't available
like #acorn. I went in there and there wasn't anyone else there!
#atari was there but I would like to be able to get onto #acorn as
well.

------------------------------
Resolving efnet.demon.co.uk
Opening IRC session to efnet.demon.co.uk :6667
AUTH: <efnet.demon.co.uk> *** Looking up your hostname...
AUTH: <efnet.demon.co.uk> *** Checking Ident
AUTH: <efnet.demon.co.uk> *** Couldn't look up your hostname
AUTH: <efnet.demon.co.uk> *** No Ident response
stimpy :Nickname is already in use.
Attempting auto-nick change
Closing Link: 212.38.177.203 (You are not authorized to use this server)
tcp_close(efnet.demon.co.uk)=No error.
------------------------------
```

This was efnet at demon. They seem to have problems looking up my hostname. I put my hostname as www.madasafish.com.

Any suggestions would be extremely helpful! Please!

>bottom 5.25 bay.

Same here. You have to leave the board sticking up into the upper
half section. Also you have to change on/off buttons. You then have
to tap off a reset switch, turbo light and the most difficult, a IDE
HD light.

>I can still get a hard drive in there tho. In total, I got
>a syquest 88, 2.1 gig uwscsi, 36x ide cdrom, 1.4 gig ide, hard drive cradle,

Currently I have just the 48x speed CDROM and 1.7Gb IDE and two
floppys but I have space for 2 long depth 5.25" drives (CDROMS etc),
2 short depth 5.25" bays and another 2 3.5" HD's.

Hi Lyndon

>>>Wasn't installed with Jinnee.
>>
>>Hm, check in extras (zusatz).

>Like I said in the other reply, I don't think I need it.

You most certainly do need it, its a system extension programmed my
Manfred himself and allows external stuff to hook into Jinnee someway or
other.

>Your using the German installation of Jinnee right?

Nope, i'm using a tried and trusted installation, when i started with
Jinnee, there was no installation sequence as such, ive worked it all
out for myself, some of it having been added to the final release.

>I'm using the English ones.

Youre using the results of DDP's, myself and manfred. :-)

>That's why I was getting confused over Scripter, as your installation
>is differnet to mine.

OK, you can stick to yours if you wish, but sooner or later it /will/
match mine, if, you want it to work correctly. :-) :-)

Although technically you are correct, it seems usual to call
characters between 128 and 255 decimal (i.e. using the 8th bit)
'upper ASCII' for ease of description. This includes the Umlauts.
Of course, the difficulty is that they are in different position
on an Atari, PC and Mac - perhaps depending on the system font in
use...

BTW, note my correction posted earlier - the problem only arises
in the Search and Replace dialog, not the text itself.

Regards, /Peter/

>
>The only way around this is to reboot after you use the clipboard
>within FWP AFAIK...

I knew that FWP had that problem, but why does it affect Everest
as well? Even to Everest creating the renamed CLIP1WP folder when
one didn't exist (because I deleted it after FWP had written it).
But I have now made further checks and find that Everest seems to
use the correct clipboard if FWP wasn't run beforehand in the
session. So it would appear that FWP not only uses the clipboard
folder in its own directory, but that the system remembers this
even after it is quit and forces Everest to do this as well.

> > Another thing: I have noticed that occasionally Everest won't

> > Again - any ideas?
>
>It could be interference from another program in the same session, but
>apart from that, none. Sorry Peter...

Thanks. Note my correction that the problem only appears in the Search and Replace dialog, but not in the text. I have not been able to pin down just *when* it happens :-(Perhaps I should check if this too is due to running FWP first?

LATER: It /seems/ to happen when I run Evereset from the desktop, either by double-clicking on it or using Thing's keyboard shortcut for Installed Application. When called from within CixRead it is OK! Even stranger...

>this is key to the running of Redirect and NVDI.

Yes, I would second that. A boot manager may also overwrite
others, depending on what you have in, say, your XBoot SETS.DAT
file. In my case, I have 4 different versions of ASSIGN.SYS, 4 of
MAGX.INF, 2 of NVDI.INF and 5 of NEWDESK.INF available for use
with various setups, all called something meaningful (so I know
what they are, such as ASINMON5.SYS for using NVDI 5 on a mono
screen and MAGX_256.INF for 256 colour use) where the ones
specified in the selected XBoot set are converted to the above
names (ASSIGN.SYS and MAGX.INF for the example) by XBoot.
Obviously if I make changes and save the desktop or other
settings, I have to delete whatever file was converted to (say)
MAGX.INF and then rename the new file to that name. Next time
XBoot is run, it will create the desired MAGX.INF again.

Can't recall now. I'll add your #_ENV SCRPDIR=C:\CLIPBRD\ now and
keep mine pro tem as well - presumably it can't hurt?

As you may have seen in an earlier contribution, my problem seems
to occur only when I start Everest after having run FWP in the
same session and quit it. The system seems to 'remember' the wrong
path (and also filename if changed in the FWP binary) used by FWP.

Hi

OK, so the Falcon is supposed to be good at audio but without the
software it's not much good.

I'd like some software that allows me to use wav or avr files imported
in and place them on the grid like cubase audio. I also need
time stretching facilities, ones that don't alter the pitch.

I've done the audio mods as well. I've tried things like Flextrax but
I've never gotten on well with any tracker.

Is cubase audio any good? I've used the PC version and I liked it
a lot. Although I used Soundforge for all the timestretching and
effects. Is there anything like Soundforge?

Thanks in advance!

Stupid question, but you did turn on Identd for these specific
servers? aIRC has individual identd settings for every server
in the server list and you need turn them on. Please make sure
when you open the Server setting window and the server you
see shown has the 'ident' button highlighted. If you have
missed this option, then set them and be sure to resave the settings.
I know the interface is a bit awkward, one day I wish to redo it. ;-)

That don't sound good. I'd power it all down, and maybe clean the VME
contact with some contact cleaner and reseat the card in the slot.
Or perhaps try that with he monitor plug first. It might be
possible the monitor is going bad?

Just a side note... I run about 6 different CAB setups all have different software setup with them such as AFTP. I have noticed the same problem discribed in the first posting on this subject. Like Martin suggested it could be a just a simple error with the configuration setup.

If I remember correctly, the problem I had wasn't with all FTP sites, only some of them would give an error. Some of the ones I remember is when on a Web page and downloading a file that comes from a FTP site. AFTP would pop up and try to download the file, then I would get an Error relating to the LOG file or CACHE (something like that) from AFTP. When this happened I did go back and check the settings and Folders for the Cache, Log and etc. All seemed to be fine, but the problem still remained.

I've not had any problems using AFTP by its self.

Greetings,

I'm looking to buy or trade for a working VIDI ST 12 and software for a Falcon.

If you have one for sale or trade then contact me by e-mail.

I have a VideoMaster Falcon with ColorSplitter and Software that I would probably be willing to trade for a VIDI ST 12 and Software.
I also have lots of ST-Falcon software, hardware and CDs for trading.

Thanks,
phantomm@bellsouth.net

Hello!

There is a new version on my home page (in sig).

TOS.s > v4 are 512Kb.
Bug fix in PC calculation for addressing modes having PC relative
base displacement.
TST instruction: Allow all addressing modes.
Bug fix in machine switching.

CBHD is its proper title. Yes, it's very much up to date.

4924. Crazy Dots problems

Newsgroup: comp.sys.atari.st
Date: 2001-04-15 21:00:21 UTC
From: ebaiz@skyenet.net
Message-ID: <FZnC6.243$J61.2057@newsfeed.slurp.net>
Source record: 47558

A friend of mine is having trouble with his Crazy Dots card that is connected to his TT. The color keeps fading in and out when he displays 256 color pictures. Sometime the color is not even there. Seems to me there is a loose connection somewhere.

If I am trying to download a file with a ftp beginning, it never works. I an sometimes get it to work when just going to a certain folder on a ftp site. However, that does not happen too often. The only time I want to use ftp when I am online under Cab, is to download a file. I hear GAPftp is good for that.

Hi,

I'm having problems running Sundog on winSTon, no matter what I try
when I try to make a library disk the software complains that the
SunDog game disk in there so it can't make the library disk.

So how do I get around this?

If this isn't the right group for emulator questions please let me
know, I couldn't find anything that looked more suitable myself

I'd suggest removing both programs and reinstalling from the master disks -
I wonder if somehow some disk corruption has crept in???

> #_SCP C:\CLIPBRD\

I believe that this is the only entry you need; everything here works
perfectly with this as the only Clipboard entry.

>Another thing: I have noticed that occasionally Everest won't
>accept the [Alt]-ASCII combination for producing higher ASCII

Hmm, depends on your tolerance: Personally, 1024*768 in 16 colours with a
50MHz clock (CT2) had me reaching for the Videlity config prog to set it
back to the 864* whatever that I have decided is the best trade-off for me.

Running a stock Falcon in the higher resolutions/colour depths can bring
problems with SCSI data transfers. Install one of the clock fix hardware
patches, or drop the res/colour depth back.

Data transfer through the serial port also suffers under the same
circumstances; drop the port speed or reduce the res/colour depth as above.

>HDDriver as a disk driver, and will see what that does. Do not yet
>know if it is mostly due to program, electronics, or drive mech.

There's a section on the Falcon's SCSI port in the manual or readme.

Cubase Audio uses the AIF-format - but there are conversion programs around
if needed...
Timestretch with CAF? It works - well sort of... It's not great, but useable
when keeping to very small adjustments. VST or Wavelab are MUCH better...
:-/

> Is cubase audio any good? I've used the PC version and I liked it
> a lot. Although I used Soundforge for all the timestretching and
> effects. Is there anything like Soundforge?

Cubase is by far the best around when you need audio and midi functionality
with a very good sync - no doubt about that!
If you've used the PC version previously, you'll probably miss some things -
like plugin effects and VST-instruments etc, but CAF is actually very good
and an impressive piece of work for such a slow machine as the Falcon. I
used the Falcon for quite a few years and was very satisfied with it :)
Nowadays I use a PC, which works even better - and actually has better sync
between audio tracks and midi/audio than the Falcon ever had...
SoundPool's AudioTracker (which doesn't have a midi sequencer) and
AudioMaster (which is a Mastering program) are also useful programs for the
Falcon. Check them out at: www.soundpool.de .
If you need some hints about what you need and hints about what might go
wrong, go to my website and have a look at the Falcon and Troubleshooting
pages.

Same problem seen here - and as you later said, it sort-of works when
called from within CiX's Atari OLR CiXRead. Sort-of, because here if I
search for a letter and replace it with an Alt+ASCII one, the letter
actually doesn't appear in the text. The target letter is deleted though.

>GAPftp is good for that.

Have you ever thought to use Cab itself to retrieves files from a
ftp-server? Should work, at least it works with my setup. The only thing
I must do is set the ftp proxyserver.
Remember for STing the syntax for the proxysettings is something like
this:

HTTP-Proxy --->proxy.pandora.be:8080
FTP-Proxy ---->proxy.pandora.be:8080

For the MiNT-Net ovl users it's something like this:

HTTP-Proxy --->http://proxy.pandora.be:8080
FTP-Proxy ---->http://proxy.pandora.be:8080

I must say that for some reason I get an "error file, not found message"
when I want to retrieve a file directly (ftp://name.of.theserver/bla/file.lzh)
with the Sting ovl (latest beta).
With the MiNT-net ovl I can retrieve files directly.

HTH,
Martin

I thought that there was a specific ftp module for use with CAB, but I'm
afraid that I can't remember what it's called. I use fiffi FWIW, and that
works perfectly as an ftp client (IConnect).

My computer came with Gap as the ftp client. I've decided to go back
to it as it was simple and efficient and most of all, it never failed
to work. I'll use aFTP for browsing ftp sites, usually chapelie
looking for files.

Thanks for the help though.

Check it isn't the monitor first. I'm sure you've probably done that.
The only thing you could do is resolder the joints on the board. Is
it fading from colour to black&white or losing one of the primary
colours, eg blue, green or red?

May be the connections to the video port, they may loosen like the
mouse/joystick ports on the Atari keyboards.

Hope that helps.

4951. UK Free ISPs ?

Newsgroup: comp.sys.atari.st
Date: 2001-04-16 11:00:13 UTC
From: kaitxo@cix.compulink.co.uk
Message-ID: <9bejbtjhf1@plutonium.compulink.co.uk>
Source record: 47580

Thanks to bindon@madasafish I can now connect my Falcon to the 'net using CAB (and STing) and an old DIAL.SCR I had set up ages ago for Freeserve. However, Freeserve seem to have changed their email so that it looks like it's now all done with Java script. That means I can't seem to set up a new account (and email) for the friend I'm passing the computer on to.

I've tried a couple of other free ISPs (freewire and madasafish) and set up accounts using my PC. However, although connection to the ISPs appears to go ok, the connection only appears to work one way - from me to them. If I enter a URL I get Error back. If I do a "ping" then nothing is coming back.

Does anyone have a DIAL.SCR for any of the current "free" ISPs that will enable me to set up an email account that I can access with the Falcon set up that they would be willing to send me (with the personal bits cut out of course).

Thanks.

Andrew Harvey

I sorted out that problem with opening ftp sites again and again BTW.
I haven't tried retrieveing a file using aFTP but I've tried before
changing the temp,downloads paths and enable dir path.

Anyway I have the same problem as you (above) with Newsie as an FTP
client. It says "it is not a file or directory" where I know it is.
I used to go in through the directorys in the end. I think I'll put
gapFTP back on.

It's not a stupid question as it was off. But it makes no difference.
I still get the "couldn't look up your hostname". I get in the log
file ~nouser@212.38.12.58, the IP address is the one that is assigned
to me that time I connect.

I'll try my spare ISP as well. Maybe it's something to do with the
settings for Sting? Does it use Stings ident settings/hostname?

Thanks.

Err, hmm, ahh I lied about the 2 floppys. I was going to try it
yesterday but never got around to it. I'll try it today as I have a
high density drive in my STE being wasted. I'll put a DD in there.
It should work if you change the ID on both drives to be different. I
did this on an Acorn A5000 and it worked fine. ID0 will be the A drive
and ID1 is the B drive.

Hi again!

>How did you cable the floppys? I tried once and it didn't work. tried
>setting up 2 drives one set to drive 1 and the other drive 0 but no joy.

Right, if you look at the schematics they haven't connected the select
line for the 1 drive (B)! It even labels it as drive select 1 but
with no connection to it! Right, I deleted my ST schematics so I
can't be too sure which pin the select line comes off from the Yamaha.
I remeber that it was phsyically next to drive select 0 but I can't
remeber if it was left or to the right.

Not sure if TOS has the code though as in the Falcon design they
removed the external floppy drive socket. Magic will support it
(I think) but that pin of the Yamaha may be used for something else.
There was a spare pin on the schematics next to drive select 0.
I'll have to compare against the ST schematics.

Time to head off to fortunecity schematics!

Bye!

> it was written (it probably pre-dated the concept tbh).

I suppose FWP uses the following AES functions:
They are used for communicating the location of the clipboard between applications.
And yes, the location is remembered by the AES.

int scrp_read(char *scrap_path)
This returns the current pathname of the clipboard if there is one.
scrp_write(char *scrap_path)
This replaces the pathname of the clipboard for subsequent retrieving by
scrp_read.

I suppose also that the #_SCP directive initializes this pathname within the AES.

Problems can arise when a program doesnt read it.

Note that scrp_write() is intended for use by configuration utilities like CPX's
or desktop programs.

>the colors. As said just 1stguide behave bad
>Are you using a background picture and if so uses that picture the system
>color palet?

No, I'm not. Some programs affect the system's color palette and this is
not a Thing-related problem: it's system-wide. The yellow stays black
until I reset the original color palette or I shutdown the system. And
just the yellow is changed.
I just took a look at the Color Setup CPX and I saw something weird:
when I select the black colour, the RGB cursors on the right are all set
to "0", which is normal. But when I select the yellow colour, the cursors
are also set to "0"! Which, of course, isn't normal. So, there's
definitely a problem here. I'd be glad if someone could explain that
strange behaviour to me.

u:\tmp is an alias of d:\tmp. d: is a minix partition.
Amail recognizes that there is an old mail file on u:\tmp
when I start it up and asks if I want to import it.
However, the import fails every time. Same thing happens
when I download new mail, which replaces the old mail file.

I went into the Color CPX and did a "save".
Now the normal desktop colors return when I exit CAB (or iconify it).
The problem now is that the background color of the desktop is now
the background color of selected items (reverse video) on the top
menu bar, and also the color of the bar cursor sometimes.
I guess I need to learn more about how the palette works.

4968. The name of the game(s)

Newsgroup: comp.sys.atari.st
Date: 2001-04-16 16:29:36 UTC
From: Piotr Adamiak <apjapj@poland.com>
Message-ID: <3ADB1DF0.3000604@poland.com>

Hi,

I am trying to recall the name of a game for the ST. This title was
based on the Living Dead series by Romero and was an FPP RPG inside a
large hypermarket. Does anyone recall the title and where can I get it
now ?
Also where there any other titles from this series / this type ? :)

Thanks in advance ! :)

Has anyone successfully used an IDE/ATAPI CD Writer (i.e. recorder)
on an Atari or clone? If so, what software did you use?
I'm thinking of adding one to my Milan, since I still don't have
a driver for my SCSI card yet.

> for this.

Sure, but 1st Guide will cover you for several of them. I've never had too much luck with Gemjing tbh, but wasn't there something called "505" that handled several formats? I'm sure you can find some small utility that'll cope with GIF - wasn't MGIF supposed to be quite good?

My other point was to ask what the problem would be with keeping your viewing program in memory? I know I'm (more than a bit) spoilt by having 34Mb on hand here, but if you're multitasking, what's the problem? If you were to complain about memory fragmentation I could definitely sympathise...

FWP must override the entire system environment, rather than affecting
single programs. That's why I suggest reloading the desktop
environment. Everest probably sees that an env var exists and doesn't
change it. I assume you have "GEM Clipboard On" in the parameters
menu? If it were "Off" it will probably force its own alternative
(which probably won't be C:\CLIPBORD\ either!)

>>> Another thing: I have noticed that occasionally Everest won't

I've just tried this and can't get high-ASCII in that dialog either
when I type it directly, but if I cut and paste from a document into
the dialog, then there's no problem. Doe sthat sound familiar?

> LATER: It /seems/ to happen when I run Everest from the desktop,
> either by double-clicking on it or using Thing's keyboard shortcut
> for Installed Application. When called from within CixRead it is OK!
> Even stranger...

I'm typing in Everest, having been launched from Newsie, and it
doesn't work. Maybe it's a problem with Everest which is compensated
for when it's launched from a modern and aware application? (But, in
truth, I made that up, so just ignore me!).

>> #_SCP C:\CLIPBRD\
> I believe that this is the only entry you need; everything here
> works perfectly with this as the only Clipboard entry.

The name of a clipboard depends on the application - it may give it its own term. As such, I've been forced to add the following over the years:

#_ENV SCRAPDIR=C:\CLIPBRD\
#_ENV TEMP=C:\CLIPBRD\
#_ENV TMP=C:\CLIPBRD\
#_ENV TMPDIR=C:\CLIPBRD\

It won't hurt to have these. If the application doesn't look for these variables then it won't find them. There should be some description in the docs if it wants to use these variables for any other reason. I always look at the Env Vars of a program and ensure they're explicit in case something else changes them unexpectedly.

>> Another thing: I have noticed that occasionally Everest won't
>> accept the [Alt]-ASCII combination for producing higher ASCII

> them - however, I realise that you use them a lot! :-)

Right-clicking on Menuinfo gives me a character table I can insert into text easily, but unless I'm mistaken Everest's dialogs are "blocking" to screen elements outside of it, rather than window'd.

Have I missed something here? How would you use INSCHAR in this situation?

4979. [WEB] Aniplayer 2001 v2.15

Newsgroup: comp.sys.atari.st
Date: 2001-04-16 18:05:58 UTC
From: didier.mequignon@REMOVE.wanadoo.fr
Message-ID: <9bfca6$8mr$2@wanadoo.fr>
Source record: 47511

Hi,

There are a new version of d'Aniplayer on my site.

News on this version 2001 (2.15):

- On FALCON when 'without GEM' is checked the right clic of the mouse
as the same results than 'ESC'.
- Now you can choice a bloc into the horizontal cursor with SHIFT-clic
or double clic, or with the right popup of the main window. The
beginning and the end are copied when a save box is called.
- Function 'INTRO' added in the Playlist.
- The quality option for MP3 (created in v2.14a) is now separated
than the general quality option. You can change this option when
an MP3 is played and save it (the MP3 quality option replaces the
general quality option in the right popup and the main menu).
- Video MPEG more fast without DSP (20% for I-frames and 10% for P
and B frames). And now the DSP writes directly to screen when
'I-frames only' is selected under FALCON and 'without GEM'.
- With MPEG files, there are a new possibility to display 1/4 of
I-frames in the display configuration box (for big pictures the
speed is increased and it's the only way to listen sound without
repeats).
- MP2 sound more fast with the DSP (it's important for video MPEG
with sound ;-)). There are an average CPU load of 4% on my CT2B
and MP2 44,1 KHz files.
- MP3 more fast with the DSP, now with the quality option is removed
all MP3 44,1KHz files are played in stereo on a FALCON with a DSP
a 32 MHz (CT60 or a normal FALCON). There are average CPU load of
15% on my CT2B and MP3 44,1KHz files. Without DSP, the CPU load is
reduced by some %.
- Bugs fixed: Save the sound of an MPEG file into an MP2 file,
MPEG files > 524 Mo (the limit is now at 4 Go), etc...
- And more...

Regards,

Didier.

Indeed you have - thanks Lyndon!
>
> Yeah of course! I use Madasafish daily and it's getting better by the
> day. I'll send it over to you, both default.cfg and the dial.scr.

Thanks for those too.

Something odd is happening. I can set up DIAL.SCRs for Freeserve, madasafish and Freewire and connect with all of them. When connected (with STinG) I can use the ping tool to ping to almost any ISP (there is one exception - see later), so I clearly have a two way connection. When I dial and connect to Freeserve, all is well - I can type in any URL and it connects. With Freewire and Madasafish, no matter what URL I type in, I get "Error File not found" (remember that I can "ping" from both of them).

To add to the confusion, I can seem to connect to madasafish, but I get nothing back if I ping it. If I connect from Freeserve or Freewire, while I can ping any other ISP, I get nothing back from Madasafish.

It's all odd - and frustrating! I don't know where the problem lies - with STinG (but it seems to connect OK and "pings"), or with CAB (but with Freeserve it's fine).

All advice appreciated!

Andrew Harvey

Hello Peter!

XL> Although technically you are correct, it seems usual
> to call characters between 128 and 255 decimal (i.e.
> using the 8th bit) 'upper ASCII' for ease of
> description.

It's certainly a common mistake. Calling characters outside the ASCII set 'upper ASCII' is really no more easy than calling them 'extended characters' or by the name of a standard if they adhere to one. It also perpetuates the myth that they are part of the ASCII character set.

Regards,
- Andy.

This weekend coming (21 / 22), there is a computer show run over both days
at Alexandra Palace. We at the Portfolio Club (UK) will be there both days
with a stand to see what it is like.
The blurb from the organisers say the following will be there :-
Computer Systems
Peripherals
Upgrades
Consumables
Telephones
Radio Transmitters, Receivers and Scanners
Satellite TV
Radio Systems
Electronic Components
So if you haven't got anything planned, why not pay it a visit.
It opens at 10pm

I have a Zoom 56k, seems to work ok for me. Got it at
a place called Staples. I'm in Ohio as well.

If you you leave the hostname line blank, it sends the IP
as seen above. If put something into the hostname line it
sends that. However, the hostname field is not used for
indent, it's used to log into the server and the servers tend
to assign you an IP anyway if your connection is too far.
Also if your IP is dynamic (changes) then setting this is
probably pointless. There is no function get_hostname() in STiK
far as I know, so the hostname field is only really useful
for someone with an fixed IP that never changes.

I am not sure what STinG offers, if it has it's own ident server
built in to the stack, I would let STinG handle the indent.
Hense the reason why I put in the ident toggle, I think STiK2
has an ident server, but I'm not sure on the either.

Just getting on IRC seems problematic for me too, I'm down to
one server that will even let me on IRCnet.

It is possible the weight of the cable hanging from the card
has caused the solder joints on the HD-15pin VGA jack to become
broken, or cold soldered.

Well the desktop comes up ok, but when he loads in a 256-color gif, the
colors are messed up. Pessing in on the connection that lead out from
the card and to the monitor alters the colors in some ways. Sometimes
the correct colors come back. I will have him try it out with a
different montor to see just what happens.

4998. Falcon RAM Problem - (HDdriver?)

Newsgroup: comp.sys.atari.st
Date: 2001-04-17 03:29:09 UTC
From: Ken Kosut <kjcat@execpc.com>
Message-ID: <3adbb8a9$0$42872$272ea4a1@news.execpc.com>
Source record: 47529

Hello,

A while back I installed a 14 meg RAM card on the Falcon.
I don't want to go into details, but during fitting,
one of the conductors on the connector of the RAM card
got damaged.

After a great deal of research, I found a connector
that would mate with an irregular pin on my motherboard.

The fitting went very well.
I booted, all programs work great for about 30 minutes.
Then I get vertical dashes on the screen and everything freezes.
I can't really reboot until the machine cools.

This same thing happend when I had the 14meg RAM card installed
with the damaged connector.
I took out the 14 meg RAM card and replaced it with the original 4 meg
Board.
Everything worked fine from then on.

Well, I am miffed as to what to do.
I raised the Falcon slightly to allow more air flow.
That does'nt make any difference.

I tightened the monitor connector. That didn't do it.

Does anyone know what might be causing this problem?
Do I have to reinstall HDDriver.sys?

thanks

ken

This should work with any CD recorder software that supports the SCSI Driver protocol, which is implemented also for ATAPI by HDDRIVER. As both SoundPool's CDRECORDER and Anodyne's EXTENDOS GOLD cd writer software support this interface, both should work. Note, however, that SoundPool's software does not support long filenames, which may be a killer argument.

I'm not that interested in plugins or the other flashy items.

>I used the Falcon for quite a few years and was very satisfied with it :)
>Nowadays I use a PC, which works even better - and actually has better sync
>between audio tracks and midi/audio than the Falcon ever had...

The PC at school with VST has a latency of about 1 second. Is this
normal for a 500 pentium 3? Seems pretty awful and crackly!
Apprantly it could be video card or motherboard. Emu card in there.
With the patchs I suppose the Falcon is quite good.

>SoundPool's AudioTracker (which doesn't have a midi sequencer) and
>AudioMaster (which is a Mastering program) are also useful programs for the

I'd prefer to have an all in one viewer that supports all graphics.
Sound will be handled by Gemjing I think. I quite liked PHPlayer so
I'll try that again. This has a nice simple interface that doesn't
clog up the display.

>My other point was to ask what the problem would be with keeping your
>viewing program in memory? I know I'm (more than a bit) spoilt by
>having 34Mb on hand here, but if you're multitasking, what's the
>problem? If you were to complain about memory fragmentation I could
>definitely sympathise...

14Mb of memory is much. Once the system started it's 10mb left. Less
programs in memory means less to go wrong. Scanner leaves me with no
memory. I'm not too woried about it taking little RAM up, it's just I
don't want a big application.

I want to be able to double click on the gif or whatever and a window
open up with it. Then I click close and it promtly closes without
leaving menus etc like Imagecopy.

Maybe I'm being too picky? What does everyone else use as there
installed application for graphics?

It's not so much slowing the system down as slowing the video refresh rate -
if you can put up with that then fair enough.

Are you sure about that vertical resolution, for a 1024 horizontal that
should be 768, keeps the 4*3 ratio.

>years:

Perhaps I've just been lucky then! ;-)

>Right-clicking on Menuinfo gives me a character table I can insert
>into text easily, but unless I'm mistaken Everest's dialogs are
>"blocking" to screen elements outside of it, rather than window'd.

Indeed they are, and most annoying that sort of thing is too.

>Have I missed something here? How would you use INSCHAR in this
>situation?

I meant that I'd use inschar to insert into the actual edit window, there's
no way that it will function in the S&R dialog.

Everest is showing its age now I'm afraid.

Has anyone got a current e-mail address/web-site details for
Carl-Michael Ewart please?

He took over the Tele-Office fax program and commenced on its rewrite
early last year, but the two e-mail addresses I had for him then
have just bounced back. They were:

carl-michael_ewert@of2.maus.de
and cm_ewert@hrzpub.tu-darmstadt.de

I should appreciate any news!

George Moulder

Hi Lyndon,

I have connected to UKFantastic at:

http://www.ukfantastic.net/

with Sting etc. If you want a copy of my config and dial, then yell at

rking@zetnet.co.uk

If you're wondering, I'm just too lazy to drop zetnet and I haven't
tried both ISPs head to head for long enough to make a comparison.

Bob King.

Dear friends,

[Chatter 1.10]

Chatter, the IRC-client for IConnect, is now also published by
Europe Shareware and its price has been cut down: 22.50 EUR.

http://www.europe-shareware.org/atari/logiciels/chatter.html

[CAB 2.8]

The well known web browser is now also published by Europe
Shareware. New price: 30.00 EUR.

http://www.europe-shareware.org/atari/logiciels/cab.html

[Pack "internaute"]

The "Internaut Pack" now includes CAB, Emailer and Chatter, and
the price remains unchanged: 60.00 EUR.

http://www.europe-shareware.org/atari/packs.html

[Aniplayer 2.15]

Didier Mequignon's indispensable multimedia player is also
available via Europe Shareware: 8.00 EUR.

Bye,
P. Ricard (ES)

5023. Free Atari Software

Newsgroup: comp.sys.atari.st
Date: 2001-04-17 12:24:05 UTC
From: kaitxo@cix.compulink.co.uk
Message-ID: <9bhcl5$ol4$1@plutonium.compulink.co.uk>
Source record: 47454

Here's a few Atari programs that are free (except for packing and carriage charges) to good homes:

Superbase Professional
DA Vector Pro
DA Vector
Calligrapher Gold
Fontkit Plus 4
Image Copy 4
Datalite 2
AtariWorks
True Image
True Paint
Positive Image
Atari ST Introduction to Word Processing (Calligrapher Lite)
HyperPaint
Prodata
EdHak

All the above are original copies with manuals

User's Guide to Timeworks DTP (book by David Smith)

I'm in the UK and would prefer to only send here - but if someone's really keen on any of the above (but be aware that some manuals are on the heavy side and could cost quite a bit to post overseas).

Please post this notice anywhere you think there may be some interest.

Replies by email please.

Andrew Harvey

I'd try the local paper or one of those papers full of private adds.
It may take a while but they're usually a lot cheaper and better than
the ones for sale over the internet. Last month I bought a Jag in the
UK, with 15 cartridge games, CD unit (including 2 games), 4
controllers (2 never been used!) and the Jag itself. Scart lead as
well with every single book, manual and orginal packaging!
It was 100ukp.

Try asking over in alt.atari-jaguar.discussion

It should be able to. The drives are mechanically the same.

>
> I have assumed that they are standard 80 track 9 sector ones and therefore
> can be read by a PC - am I right in this?

Most early (pre 1.6) versions of TOS wrote a boot sector that many versions
of MSDOS does not understand.
Later versions wrote an MSDOS boot sector.

> What if they are non-standard (ie 10 sector) can modern HD drives cope
> with funny DD disks??
>

I would think so, but its the software that may give problems.

> I hope that you may be able to give me some guidance on this as I don't
> have a PC to test anything out on! Also I am hoping he will make the

If he has problems he can probably use one of the ST emulators to read the
disks and
copy to the hard drive. Both WINSTON (www.atari.org) and GEMULATOR
http://www.emulators.com/ can do this.
Failing that if he still has his ST there is a program to copy data via the
parrallel cable.

> Maybe I'm being too picky? What does everyone else use as there
> installed application for graphics?

I personally use multiple programs for different features. Having a Falcon, I normally use JPEGD, 1st Guide, Apex DSP GIF viewer, ST Guide, and Look 'N' See. I too wouldn't mind an all-in-one program, but owning a Falcon, it'd be tough to find one that uses the DSP as well as displaying everything I would ever want to view. So I stick with multiple programs. If Look 'N' See didn't make the screen an odd color, I wouldn't mind that as an all-in-one.

I use Cubase VST , i had excellent results on a Celeron 366 using the SB live soundcard. No noticeable latency at all, stunning results and managed 8 audio tracks with virtual effects.. Superb! now Ive upgraded to a Pentium III 700 and it flies! Soundcard is really important, a PCI fully duplex 16 bit card such as the SBlive is a good choice for low cost. I tried an AWE64 gold but not very good and only plays back in crackly 8 bit when recording. I also suggest a reasonable quick EIDE drive.

That's even stranger - in my case I *always* get the replacement
in the text (provided I can type the character to be replaced or
the replacment), no matter whether the extended-ASCII character is
in the Find or Replace line.

On a related topic, strange things happen with the ISO conversion
sometimes. I am used to both the Mac and PC type of Umlauts, but
recently on some mail from Ulf I got nothing at all for Umlaut-o!
Just a space. Normally I get the division symbol from PCs, or
'=F6' if qp was used.

I use the Apex viewers for GIF, TGA and JPEG files as well as FLC.
These have the advantage of switching automatically to Hi-Colour
no matter what resolution you are working in as soon as you click
on the image file, and then back to the original resolution when
you quit by pressing a key. They do leave the screen incompletely
redrawn on my Falcon, but the MagiC 'tidy up' call cleans up
everything again. But I only know of these four programs, not for
other graphics formats. For those I use Look'n See, which is my
default viewer.

As I've said before, if he still has access to an Atari, there is
a PD program DISKMOD.TOS used to write an MSDOS-compatible
BLOCK0.DAT file to the boot sector of early Atari-formatted
disks *without changing the contents of the disks*. I don't know
if the program would run on an Atari emulator - one would have to
try it with a scrap disk.

At 10, (actually 11 to allow for failures) for a pound, guess!
They're a mix of whatever has come in with purchases, all sold as blanks,
to be formatted by the user, Fastcopy III with verify on and std format
recommended.

Maybe it doesn't if in 15bit colour mode? For sounds I'm using PHPlayer
which is quite good in my opinion. I'm still searching for an image viewer
though. I tried Imagecopy and remebered why I didn't use it as my viewer
last time I tried, it can't have parameters passed to it and doesn't support
drag'n'drop. Gemview just felt "old" and slighty messy interface. Couldn't
understand a word of Graftool.

ATTENTION RETROGAMERS, COMPUTER COLLECTORS, VIDEO GAME FANATICS!!!!

WE'RE BACK!!..

CCAG 2001
(Classic Computer and Gaming 2001)

If you like collecting old computers, video games, and enjoy using them
still, then come join us on:

June 30th, 2001
9AM till 6PM

National Guard Armory
IT'S ON ROUTE 57!!!

(actual address)
3520 Grove Avenue
Lorain, Ohio 44055-2048
(On Route 57, going North of I-90/Route 2)

IT'S FREE!

Both vendors and attendees!
Computer User Groups and vendors inside, flea market outside!

5,000 square feet of indoor space and an additional 5,000 square feet of
outdoor space is available along with ample parking.

Setup: 29th, June, 2001
6PM-10PM

Please Call Ahead for Reservations:

Jim W. Krych jwkrych@n2net.net
440-979-9295
Fred M. Horvat fmh@netzero.net
440-286-2566
And these other CCAG 2001 organizers:
Thomas J. McLaren sirthomas@uk2.net

Please visit this site:
http://tomheroes.com/ccag.htm

As of 04/17/2001
User Groups:
Erie PA Atari Group
TI Chips

Cleveland Classic Atari Group

Vendors:
C.S. Vintage Games
L.R.O. Computers
Tomorrow's Heroes
Retropolis
Songbird Productions
Video Game Connection
Ramcharged Computers

People/Organizations:
Fred Wagaman
Harry Dodgson
Alan Hewston
Thomas Mclaren
Andy Frueh
Classic Gamer Magazine
Curt Vendel(Atari Historical Society)
John Litva

Possible Attendees!!!
Michael White(Bally/Astrocade)
Atari7800.com

Special Guest!!!
Pitfall Harry

We are looking to do a "Classic Game Experience" this year!
One room is going to be set up for playing classic computer and video game cartoons and commercials. The other room is going to be an emulator room-MAME, etc.

We already have one person bringing a Crazy Climber cocktail arcade game, John Litva. Please email us if you wish to bring an arcade game to the show.

See ya at the CCAG!

5047. Serial 2 on TT

Newsgroup: comp.sys.atari.st

From: sidcelery@cix.co.uk
Message-ID: <9bihg4$mo8$1@plutonium.compulink.co.uk>
Source record: 47477

Hi All,
I finally picked up a 57k6 modem recently, so before I set it up with all my software I thought I'd move my existing 33k6 over to Serial 2 and ensure that was up and running first. Typically, I'm having problems which I'm sure someone can help me with.

I've installed HSmodem 7 to look at the Serial 2 port and disabled STinG. I've set my Terminal program to look at Serial 2 and selected the 150 baud, which should remap through HSModem to 115k2.

The trouble is that the terminal starts up with the report that the modem is online (which it isn't).

I've adjusted everything that would seem to make sense (and one or two things that didn't), but to no avail. Can anyone point me in the right direction with this problem?

Odd--same thing happened to me. Additional detail--contacted them by
e-mail was told that there were none, but two could be found, to be
shipped Friday, a day which is now long in the past. That item, a 14MB
upgrade, is a catalog item on the web page. I would still like to have
two of those, but ordering from the only source does not work.

Me neither. I still use external units for almost everything and just an
occational plugin effect...

> With the patchs I suppose the Falcon is quite good.

VST with a latency of 1 second? Terrible! You must have a soundcard without
ASIO drivers then and they're unusable for serious work. My RME Hammerfall
can go as low as 1.5ms latency if using just a few tracks, but in normal
cases, about 6ms - which is totally unnoticable. The rest of my machine is a
PIII866/512MB PC133 RAM/Matrox G450DH/SB Live player 5.1 for games and
stuff.../UDMA100-disk for the system and an UW/LVD SCSI-disk for audio (an
UDMA-disk would have been ok too though...).
I've made some testing of my system and when running 52 audio tracks
simultaneously (which is the limit of the Hammerfall card), with compressor
on every track, plugin effects on about half of them - and 4 Master effects,
I still have no problems. All the tracks stay in sample accurate sync
(something the Falcon simply isn't capable of).
Sorry for being a bit off-topic (this being an Atari-group), but I just had
to comment since the behaviour of your PC is insanely bad...

That's a great price and if you don't need more functions than what CAF has,
why should you pay more for a system which has more functions than what
you'll ever use...?

I have a TT, and a modem, and use Serial 2. I do not disable STiNG, and
according to the Modem Setup CPX, am calling for a baud rate of 150,
and am using HSmodem 7. CoNnect and STiNG to a PPP connect both work
without me changing anything.

How did you go about disabling STiNG?

Source record: 47484

Hello All

Some of you may have heard that Dr T's Midi Ax has been released as Shareware. Midi Ax is an Alternate Mouse controller bundled with the Dr's previous algo-comp application FINGERS.

I have created a special edition of MIDI AX bundled with KCS ver 4, which is the envirment that Midi Ax likes. I have also created a tutorial to get you started. It is within the ZIP itself

Go here:

http://groups.yahoo.com/group/atari-midi-archives/files/APPS/ALGO/MIDIax/

The special edition is configured to run from A drive, but read the directions on this from the tutorial.

In this DIR are also example files (mids) for you to check out as well as the FULL docs.

This is a great program and worth exploring. If you find you are addicted to it, please send in the shareware fee, which is to buy one of Dr T's videos. Its great stuff anyway! well worth it! See my Midi Ax page for details.

Would invite any comments on this new edition of Midi Ax, or any problems you have as well.

Tim

> card? Sounds like a dickey ram chip.

The card is a 4mb/16mb. Jumper is set to 16mb.
I have never tried it in 4mb mode. I was referring to the original
Atari 4mb board.
Simm module is PS/2 EDO RAM 16mb 4x32 60ns
Simm module comes off in one piece.

An electronic technician that I spoke with today suggested the same.
He can check the RAM for me, but not the board.

thanks

ken

Go here:

Electronic Cow
EC's Atari Midi apps now FREEWARE.
http://ds.dial.pipex.com/electronic_cow/cownet.shtml

Look for SQUASH IT. Excellent ! has 45 different processors to alter sound.
Docs are on line and printable as well.

They also have some cool midi stuff as well. Looks good on the Falcons Higher
Reses.

5057. Quick FAQ looking for a new maintainer

Newsgroup: comp.sys.atari.st
Date: 2001-04-18 06:03:34 UTC
From: Nicholas Bales <bales@online.fr>
Message-ID: <W6aD6.1540$8D.3346526@nnrp1.proxad.net>
Source record: 47488

Hi Atari people!

Some of the oldest people on here probably remember me. I used to be rather prolific on this newsgroup. I'm the original maintainer of the Atari ST Quick FAQ at http://quickfaq.atari.org or http://bales.online.fr/atari

Unfortunately, due to family and work obligations, I no longer have the time or motivation to maintain the FAQ. I'm afraid to say that I haven't switched on my atari for a year.

Rather than just let the FAQ die, I believe it would be better to hand it over to someone who really cares and has time to maintain it.

What is the work involved? Well, a large proportion of the links need refreshing, and it needs some general re-writing in some areas. I think it should be refreshed at least every 3-6 months, and a little promoting every now and then.

So, if you're interested in contributing something to the Atari community, let me know. After a week or so, I'll let you know how is The Chosen One...

Thanks,

Nick

FamilyNet Newsgate

Hello Michael!

MF> Just wondering if anyone has ever figured out if there's a way
> to connect an iMac to a Falcon for file-/web-/printer-sharing?

From a hardware point of view I imagine you'd want a USB-Mac Serial port adaptor, and a DTE-DTE serial cable (a regular Mac printer cable would likely do the trick).

The software side is more tricky, and hopefully someone here will have more of a clue than I do. File, printer, and Internet connection sharing are all do-able under unix (and possibly under MiNT). Perhaps similar programs are available for MacOS, I don't know. I would be interested in knowing the answer to that one myself.

Regards,
- Andy.

My first impressionas of QED (using it now) are that its
slow on a standard Falcon. Well, maybe not slow, but it
has that annoying "feature" that if you hold the arrow key
down to scroll the page it keeps on going after you've
released the button. I might give Luna a try...

I like the look of QED though, and it can open binarys
which means I might have a go at translating so of my German
software I have (for programming GALs)

Of course, if you hit the "#" key while the Imagecopy menu is on
screen it reduces to just a desktop menu but still stays in memory.
Imagecopy is much slower than the likes of 1stGuide and won't handle
MPEGs, but you could also try Aniplayer, which handles both sound and
images?

Well, that's it! I use Install Application to load the best viewer for whatever file type I'm loading. Unless you want to keep the application in memory (which you say you don't) there's no especial need to just have one application.

>> If Look 'N' See didn't make the screen an odd color, I wouldn't
>> mind that as an all-in-one.
> Maybe it doesn't if in 15bit colour mode?

256 colour mode is where this usually goes wrong, especially with 1st Guide as other people have already said. the thing I liked about Graftool (or was it Photoline?) was that the colors changed when the mouse hovered over the image, but changed back when the mouse hovered elsewhere! Very neat!

> I tried Imagecopy and remebered why I didn't use it as my viewer
> last time I tried, it can't have parameters passed to it and

Eh? D&D works well - even via the Appline bar!
What parameters did you want to pass to it?

> Gemview just felt "old" and slighty messy interface.

I always hated it tbh.

> Couldn't understand a word of Graftool.

Worth persisting with IMO.

> What about the DTR ?

On the modem itself the only lights that come up are DSR and HS,
whether booted into the Modem 2 setup or the Serial 2 setup.

Shall I confirm the options I've got setup with DRVIN and SCC.PRG?

I'm using Magic 6 and a Crazy Dots 2 graphics card, so the backplate
is plugged in internally and is hanging out of the VME port. The 9-pin
cable is dangling between the printer and monitor cables. The printer
is off. So, the settings are:

DRVIN:
Fastint N N
Exopen N N

SCCM2 SCCS2
M2TT U U
M1EMU U U (also tried with 2)
LANBIT N N (also tried with Y)
LANEXT N N
LAN_S2 U U (also tried with 1)
DTRM2 Y Y
DTRS2 Y Y
M2DRI N N
S2DRI N N
RBLM2 16384 256
TBLM2 8192 256
SBLM2 256 16384
TBLM2 256 8192

SCCM2.PRX and SCCS2.PRX are renamed to SCC.PRG for each attempt. The
config files for my terminal are installed in a similar manner.

SCCM2 works perfectly - that's how I'm talking to you now!

All help appreciated.

For sale (UK) - Titan Designs colour "Graffiti" genlock unit for Atari STE

Made by Titan Designs, this is probably a rare item as I don't believe many were made.
Its a small box with 3 knobs and a button for overlay mode (from what I remember as I dont have the unit infront of me at present). As far as I know it only works with an Atari STE. If anyone is interested, please contact me and I can get some more info for you.

> would likely do the trick).

Another option would be to replace the iMac's internal modem with
an RS-422 card, which would then allow connecting the Falcon's
LAN port to the iMac using a Mac printer cable as a null-modem.

I cannot recall who makes that RS-422 card anymore, but it was a
rather popular item with early iMac adopters that wanted to keep
some compatibility with their existing AppleTalk network.

Btw, an easier approach would be to use a Mac-to-DB9 adapter
(a.k.a. Mac modem adapter) on the LAN port. Since the TT boots
with LAN selected by default (and, thus, Serial2 disabled), it
would save you a lot of troubles.

I have a TT 030 with the 19 inch Atari monitor that I am really not using much now and was wondering what they are worth now.

It has 16Mb of TT RAM and 4 MB of ST RAM a 1Gb Disk and is clean and tidy.

Any thoughts/offers?

Julian

Well, on the iMac side, there are OS plug-ins that came with it that say
they activate web, file, and printer sharing. I'm not sure what protocols or
anything they use, though. I'm most interested in file sharing and internet
sharing, as there are times when my wife and I would both like to use the
internet at the same time, or when I'd like to transfer a file between the
two machines without having to go through the whole process of E-mailing it
to myself. It would be especially useful if I someday got DSL, Broadband, or
a Cable modem for the iMac. I could then use the Mac as a server for the
Falcon to run off of. Besides, I have this RS-422 port on my Falcon that's
just going to waste! :)

Source record: 47414

I visited a site which has a malformed page - it doesn't have a HTML, HEAD or BODY section and just starts with the body HTML.

CAB rendered the source code instead of interpreting the HTML. Netscape renders it OK.

So is it CAB at fault or Netscape?

Obviosuly, the page is wrong anyway. But shouldn't a browser recognise the MIME type and interpret the file accordingly? Or perhaps that is what CAB is doing but since it's not properly-fromed HTML it can't do anything with it.

As far as I can tell, if a page looks like HTML but is sent with a MIME type of Text, the browser should just display the soruce code. But if it's just a text file that's sent with a MIME type of HTML, then it should interpret it like HTML and format the text accordingly.

I don't understand how MIME types are sent though. The sever adds that to a page presumably, or is it set by a DOCTYPE definition at the beginning?

>screen it reduces to just a desktop menu but still stays in memory.

Yeah, but once it's opened I can't pass parameters to it for opening
more files. Maybe it's because I'm only using version 4? Last was
4. something.

>Imagecopy is much slower than the likes of 1stGuide and won't handle
>MPEGs, but you could also try Aniplayer, which handles both sound
and >images?

That's a good idea! I'm going to register Aniplayer so I could give
that a go. It certainly supports sound but I've never tried it on
graphics. Also it doesn't clutter the screen and it's got support
for drag&drop, and it's still developed etc etc. Only 8 euros at
europe shareware....

>What parameters did you want to pass to it?

Hmm, my version doesn't unless there is an option to turn it on
somewhere. I use v4, but I think I need to upgrade to 4.? to get
that support. If I drag a picture onto it it doesn't to anything.
On my old system I had the latest version of Imagecopy and I remeber
being able to drop a file onto appline and then it would load it.
Must be my version.

I am looking for a way to easily transfer lots of files from my Atari
to my PC via a serial link. I want to have the directory structure
preserved. Is there a such software? It doesn't necessarily have to run
on the PC, as long as I can run it under an emulator on the PC.
I experimented some with Jekyll, running STonX-DOS on my PC, and
managed to transfer some files, but as far as I can tell Jekyll doesn't
preserve the directory structure. :(

I wouldnt recommend TTdigger for that.
It is not an editor. You can produce a assembler source file, which can be
huge, change it with a text editor, and reassemble it. This is far too riskie for
otherwise well performing programs.

You're just using a demo version, which doesn't allow on-line
operation. However, as WenSuite is an unfinished beta-release, I
would advise you to use Draconis or CAB instead.
There again, Draconis seems to behave strangely sometimes, extending
the pages over tenths of screens, beeing slow and crashing often...

Harry Sideras wrote on Wed 18-04-2001 13:34 (GMT):

> On the modem itself the only lights that come up are DSR and HS,
> whether booted into the Modem 2 setup or the Serial 2 setup.

I don't know what is HS in this respect. I have right now DSR, RTS and
CTS lit up. DTR is not lit up cause dialer.acc is launched and disabled.
STinG 1.26 is running with one cpx (not needed) and the serial cpx is
the one from the STinG package.: it allow you to set up the exact bps
rate you like, without messing with fake values. I can launch my
terminal (StarCall) without a problem in this case but it will lock up
if the dialer is enabled.

> Shall I confirm the options I've got setup with DRVIN and SCC.PRG?

Magic 6.10 here but I don't think it's the problem, with a Nova 32 in
the VME bus. The assembling (towered) has been very well done by the
previous owner ;-) and nothing is dangling :-).

> DRVIN:
> Fastint N N
> Exopen N N

The same here.

> SCCM2 SCCS2
> M2TT U U

> RBLM2 16384 256
> TBLM2 8192 256
> SBLM2 256 16384
> TBLM2 256 8192

M2TT 1
M1EMU 0
LANBIT N (also used Y too)
LANEXT N
LAN-S2 1
DTRM2 Y
DTRS2 Y
M2DRI Y
S2DRI N
all buffers at 16384

The main difference between our setups is for M1EMU.

> SCCM2.PRX and SCCS2.PRX are renamed to SCC.PRG for each attempt. The
> config files for my terminal are installed in a similar manner.
>
> SCCM2 works perfectly - that's how I'm talking to you now!

Not a great diff between you two setups, just the buffers.

I have two "modems" attached to the TT: an ISDN TA on the serial 2 port
and a 56k modem on the modem 2 port. Both work well with either STinG
(or Stik2 btw) and StarCall.

Does both your modems give the same problem ?

Bye,
/Pascal/

Well, I appreciate the tip, but their website seems to indicate that
they only sell Macs. I went to www.systemsolutions.co.uk. Is this
correct?

Thanks,

John

I would recommend Edith for that. It will import a binary, change a binary,
and save that binary. Just save a separate copy of that program first,
and do not change the length of any text.

Newsgroup: comp.sys.atari.st
Date: 2001-04-19 01:40:41 UTC
From: guitarra@afn.org
Message-ID: <9blfmp$164oc$1@spnode25.nerdc.ufl.edu>
Source record: 47443

Hi:

A while ago I connected my Mac Performa to my Falcon using the Mac printer cable. I connected the printer cable to the Mac modem port and to the falcon LAN port and use Conect as my terminal software on the Falcon. On the Mac I used Termy. This works very well. A faster way to transfer file is to record files to CD or even and external scsi HD. Many of the Atari programs would run from the CD on the Mac using MagicMac.

Anybody know how to make Sundog run on a TT030??? Preferred from the hard drive, but I think only a cracked version would work off the HD which is also acceptable. I own an original and have a copy of the cracked version. Any thoughts?

Thanks
-Jeff-

> beginning?

In this case the MIME types are related to HTTP not HTML, so the DOCTYPE definition has no bearing on things.

Just a guess, but I think CAB received a page generated through server-side scripting and didn't know how to process it correctly. The page should have been parsed by the browser but instead was treated as an unknown file type. A good example of this is finding the odd image in CAB's cache with the cgi extension instead of jpg or gif.

So, you can probably blame either CAB or its overlay (or both) for not interpreting what was generated from the server. But it's hard to say without checking the URL directly (pass it on to Dan Ackerman if you're using his overlay). CAB will display malformed HTML, though, so I'm convinced the problem is elsewhere in the chain.

I find a dedicated file or sector editor to be a better bet than QED.

You can more readily see the nulls which (usually) act as terminators for
strings, less chance of overwriting them.

Use Look'n'See to hook ASCII from the binary, copy the text sections of
interest to the Clipboard, and use GEMtrade on the copied text.

D&D does work, but IME it isn't very reliable if several files are sent to
it at once. It also isn't keen on long filenames IIRC. In short, it's
showing its age.

As I said elsewhere, I currently recommend a file or sector editor. My thoughts turned towards TT Digger because frequently, the German for such common words such as "Edit" are much longer than the English. Thus, if you edit in the binary you end up with ugly spaces in menu bars etc.

Disassembling a program, editing the text to your liking and then reassembling would allow a much tidier result. It's beyond my talents though, I'm afraid :-(

I do no know if this is the same one, but I have a "pizza box" with the
word "LACOM" written on it.
This box contains a Syquest 44 drive, and a SCSI-DMA converter card.
I've got troubles too, but not with termination problem, since it was
working fine with my Syquest and another 120megs drive. The problem
is that I never manage to use a drive of more than 200megs with it.
I tried numerous models and capacities, and never manage to get the
drives recognised, except a 32x Plextor CD Rom drive :'(

There is Ghostlink which uses a null modem cable or else PARCP which
uses the parallel ports.

No, it wasn't Javascript. Definitely HTML! If there was any
Javascript there, CAB would ignore it anyway and just render the HTML
it *could* understand.

Hmmm, after thinking about it, I don't think it's CAB that's to blame.
I've asked the webmaster to correct the page by adding HTML/TITLE/BODY
sections, so we'll see if that corrects the problem.

I still don't understand about MIME types though. If it's set by the
server and not the source code, how does it know if it's sending a
HTML file or a text file, or a JPEG? Is it file extensions?

Maybe the server scans the page for DOCTYPE and HTML tags, and JPG
headers, and adds the appropriate file type. In which case CAB is
performing correctly, as the server obviously hasn't recognised that
it's HTML.

5128. ELFBACK v3.0 released

Newsgroup: comp.sys.atari.st
Date: 2001-04-19 19:04:44 UTC
From: elfsoft@mindspring.com
Message-ID: <9bncsc$m3k$1@slb7.atl.mindspring.net>
Source record: 47360

ELFBACK v3.0 has been released. It requires TOS 1.4+ and a
GEMDOS compatible file system (no long file names).

The only new feature is registration by key file. Also, the
improvements in data compression since 1997 have finally been
implemented, plus some minor bug fixes.

The move to v3.0 has more to do with ending support for all the
compression methods used by v2.0 through v2.11. There were just
too many of them, and some were unreliable. The LZA method used
here is about as efficient as possible, and has been thoroughly
tested. (I now have an external hard disk, which makes testing a
lot faster.)

If you have registered previously, contact me and I'll send you
a free keyfile.

>
>You're just using a demo version, which doesn't allow on-line
>operation. However, as WenSuite is an unfinished beta-release, I
>would advise you to use Draconis or CAB instead.

Even in its unfinished beta-release Wensuite is much better then Light of
Adamas. Wensuite is rock solid and very very fast. Pages which tooks
almost a minute before Cab displays then are displayed in less then
20 sec with Wensuite. Adamas is even slower then Cab.

Some figures done on a Hades running freeMiNT 1.15.10b/N_AES 2.0.0, 256
colormode
Test: reading offline a test page containing 13 midsized progressive.
jpg's (35-65 kb) and two small gif's.

1) Cab 2.70e: load time: 1'46"31
2) Cab 2.80: 0'49"75
3) Wensuite 3.30c: 0'17"82
4) Adamas 1.72 pl3: 1'24"86

Note on Adamas. None of the 13 jpg's were displayed correct. In fact one
could barely see what the picture was.

As you see there is a big different between 2.70 and 2.80 but be aware
that this applies to progressive jpg's. If the page contains only normal
jpg's and/or gif's one will not notice a speed difference.
Some people have reported me that with MagiC one hardly see a speed
different between Cab 2.70 and 2.80

>There again, Draconis seems to behave strangely sometimes, extending
>the pages over tenths of screens, beeing slow and crashing often...

Crashing is the most important strenght of Adamas. No program can perform
better then Adamas. It's really the World Champ crashing.

Last thing I heard about Wensuite was that one of the two orginal
programmers is still working on it.
Almost a year ago one of these guys said that they were thinking to
release Wensuite as Open Source but sofar no sign of it.

>the US?
>Where? And how much?

Hello John,

You won't be able to get one in the USA AFAIK, but you can order a
board (with a 040 or 060 + S3 graphic card + cables neccesary to
install the board directly into a "Baby-AT case") directly
from Milan. There are two boards available, one with the 040
and another with the 060 upgrade. I would wait before you buy the 060
board, my Atari dealer in Holland said the hardware is o.k. but
there are some problems with the MVDI which have to be fixed
first.(The board with a 040 is ok, I have one myself)

The poor boar deems to be... well, poor. Probably a faulty component
or a bad solder joint somewhere, which gets worse as the thing heats up.
Does it work better if the machine is left completely open to reduce heating?

Maybe you might measure supply voltage somewhere on the board, at power
up, and then after the machine freezes. A bad contact on the connector can
make supply drop out of tolerance after a while. If there are any TTLs
on the board, supply voltage can vary only +/-5%; other types of chips
are more tolerant.

I have two of those drives, as well as one of the similar 200Mb versions. I use ICD software on my drives, too. I've had my share of problems, but almost all have been traced to faulty cartridges. The only problem I've had that wasn't related to a cartridge was due to a weakening drive power supply.

The fact that your drive is spinning up and attempting to operate at all would seem to eliminate the power supply. I'd try another cartridge. I know that Best Electronics sells them, and I've seen them listed a couple of other places that escape me at the moment.

Just in case though, I'd measure the voltages on the power supply, too.

This is interesting, as from my experience Adamas pictures have always been rendered much nicer and clearer than CAB, which in turn tends to look nicer than WenSuite. Is the problem above because of progressive JPG's as opposed to normal JPG's? I've never run into this issue before with my experiments of Adamas. I totally agree with the speed issues, though!

> Crashing is the most important strenght of Adamas. No program can perform
> better then Adamas. It's really the World Champ crashing.

Although I haven't got the full version, I have never once had the demo version (which I use with Sting's Draconis emulator). Is the full version less stable than the demo? The only big problems preventing me from using Adamas with Sting is how it at times doesn't pick up on certain connections (although some pages actually download easier than with CAB), and the gross lack of features (such as the ability to assign viewers to different file types).

Anyway, I just wish something new would be done with CAB or HighWire.

Oh, isn't that lovely now! Abandon a significant portion of the already tiny
Atari market with their "commercial" product because of a few people who
complained about some problems they had. What's up with that?!?!?!

> BTW, they claim Javascipt support in version 4. Oh well, I guess.

This would be helpful, but only if they made it support the emerging TCP/IP
software standards instead of their own.

Sounds like your NVRAM settings got messed up. Get an NVRAM setter program (I think there's one in your Falcon system disks, or can be downloaded from any Atari FTP site). Set your language preferance to English with this program.

Now, you need to install ther ncurses terminfo database
(/usr/share/terminfo), part of the ncurses-5.1 sparemint package:

http://wh58-508.st.uni-magdeburg.de/sparemint/html/packages/ncurses.html

Very interesting. Can you explain what problems? I use over a year now the
060 update (I was one of the first beta testers) and never experienced any
problem with the graphic card.

5153. [ANN] NoSTalgia 1.0

Newsgroup: comp.sys.atari.st
Date: 2001-04-20 09:19:36 UTC
From: ph.gerin@NOSPAM.com
Message-ID: <1es5t0y.7klc80g1hfwkN%ph.gerin@NOSPAM.com>
Source record: 47385
Cross-posted to: comp.sys.atari.st,comp.sys.mac.apps,comp.emulators.misc

NoSTalgia 1.0 is now available get it at :

http://users.skynet.be/sky39147/

NoSTalgia is an Atari ST emulator for the Macintosh.

What's new in version 1.0 ?

- This version runs on OS X (Carbon) or System 8.x/9.x.
- Added overscan low.
- Added "freeze" , "unfreeze" functions.
- Fixed MFP/new code (Captain blood rasters, Interphase,...).
- Fixed MFP vector (fix lot of programs).
- Removed OMS support.
- Fixed bug in CPU, instructions timing.
- New Audio support (no samples yet).
- Fixed shifter timing.
- Better control of the emulation speed.
- Added an 'Auto frame' option to help the emulator when the CPU is too slow.
- Fixed several bugs in the FDC emulator (Drakken,...)
- Fixed the keyboard synchro code.
- Fixed the real time clock (Captain Blood).
- Most of the code has been rewritten.

Notes:

- Direct screen drawing is still present (and much faster) but is NOT recommended under OS X.
- You cant 'hog' all the CPU under OSX.
- Quickdraw performances are not great with OS X, NoSTalgia runs faster under 0S 9 in Quickdraw mode.
- NoSTalgia is too slow in 'Millions Colors', switch to 'thousands Colors'.
- The emulator may be slower when 'max speed' is enabled because it doesnt skip any frame in this mode.
- There is no 'Full screen mode' with OS X.
- You cant hide the Mac mouse with OS X.

Most likely this is the source of the problem and its relation to CAB.

CAB will display a page without HTML/TITLE/BODY, so I don't think it's
the markup that's causing the browser to fail.

> I still don't understand about MIME types though. If it's set by the
> server and not the source code, how does it know if it's sending a
> HTML file or a text file, or a JPEG? Is it file extensions?

Yes, the file extensions and how the server is configured to interpret
their content-types, which are subsequently sent through HTTP. A script
can set the content-type and pass it along through HTTP; this is
somewhat different than a browser accessing a file directly, whereby the
server is configured to handle the most common file types based on their
extensions.

> Maybe the server scans the page for DOCTYPE and HTML tags, and JPG
> headers, and adds the appropriate file type. In which case CAB is
> performing correctly, as the server obviously hasn't recognised that
> it's HTML.

No... only a browser or validator would care what DOCTYPE is present,
and only the most recent browsers will do anything substantial with the
declaration (e.g. Mozilla). A server won't scan (parse) the HTML unless

it's configured that way (as with server-side includes).

After executing the script, the server sent out data through HTTP that CAB didn't understand (again, no fault of the markup itself). Most likely CAB and its overlay aren't performing correctly. You would have to tap into the data stream and look at the HTTP headers to see who's at fault. That's why troubleshooting the problem should go to the author of the overlay you're using. It may be a limitation of CAB, though.

What happens if you use a different overlay?

Post the URL, including what actions you took once there, so others running different CAB setups (STinG/STiK/MiNTNet/IConnect) can test the results.

According to the appropriate page
http://gem.win.co.nz/mario/hardware/ide.html the ST IDE interface will fit.
As the STE version requires a socketed CPU I guess it attaches to the CPU.
ST's and Megas both use the
Dual In-Line version of the 68K, which I think is soldered in, making
interfacing a little tricky, as you have to solder to the CPU.

STEs use a square chip, which is usually socketed so making add-ins easier,
as they can clip on/over/round the CPU ship.

I have seen many articles on upgrading the memory to 4 Meg, but I have not
tried on mine (yet).....

5160. Cascading Windows

There's a Web site called Bountyquest that offers cash rewards for finding "prior art" that can invalidate patents. They recently posted a bounty for "Menu for Cascading Computer Display Windows" -- basically, a software program providing a menu selection that arranges windows in cascading (overlapping) fashion. The person who firsts shows documentation that this technique existed prior to February 15, 1986 will win $10,000. There has got to be some early ST documentation that describes this technique. I don't have much in the way of ST programming docs, but maybe you do.

Yep, that was what they told almost a year ago. In the meanwhile one of
the two original programmers has quite the Wensuite project leaving just
one guy to finish the job.
Indeed they have no plans whatsoever to release (if it ever will be
released) a English version. I can't remember me much details but after
the first English release they've received some negative comments about
Wensuite and that was something they couldn't accept. They have received
quite some negative criticism from the French people too. IIRC this was
the start of a rather heavy war in fr.comp.sys.atari

>
>BTW, they claim Javascipt support in version 4. Oh well, I guess.

And they claimed that it would be possible to use Wensuite with other
TCP/IP stacks too.

Maybe my eyes aren't that good as yours but really I don't see any
different in the quality of the pictures between Cab 2.80 and Adamas, at
least not in 256 color mode. BTW: Draconis and Wensuite can't handle 32b
color mode. The colors are completely wrong.
But I agree with you that Wensuite doesn't render the picture as nice as
Cab does.
The problem is indeed the progressive jpg's. This problem has been
reported several times but even the latest version still displays the
pictures bad.

>less stable than the demo?

I don't think so. The only point that is better in the demo is the fact
that one couldn't use javascript. When Java script is enabled one can
hardly visite a page. Even a very basic script, like the counter on my
homepage brings Adamas into big trouble.

>The only big problems preventing me from using
>Adamas with Sting is how it at times doesn't pick up on certain connections
>(although some pages actually download easier than with CAB), and the gross
>lack of features (such as the ability to assign viewers to different file
>types).

I've used Adamas a few times to get on pages where Cab failed but after
2 minutes surfing on these pages the fun was over. Somehow Adamas wasn't

able to read the data in the cache so I ended up in a empty page when I returned to a previous visited page.
Luckely for me Dan Ackerman was so kind enough to improve Cab-for-Stik.ovl. With the latest cab.ovl I can visite now these particular pages with Cab.

>Anyway, I just wish something new would be done with CAB or HighWire.

I'm afraid Cab is complete history. AFAIK, the Highwire project is still alive.

Hi!

Little problem here that's got me stuck.

I use QED (after getting fed up with Everest) as my editor and now after the Organization: line is written it doesn't do a carriage return so the subject line is written right after it. Obviously other peoples mailers don't pick up the subject and it ends up with no subject. At the moement the only solution is using a character in the organisation field (a dot if you look) or switch back to Everest <shudders>.

Thanks! I think this is probably a FAQ re Newsie+QED

>results.

Hmm, it's http://www.coastercount.com/ - a database of roller coasters
that allows you to tick off which coasters you've ridden! One of my
little hobbies...

Whether anyone will want to bother testing this out for me I don't
know, you need to set up a username and password from the Sign Up
link, but that is very straightforward and quick.

From there, you go to the Add Coasters page and then choose a park
that's listed.

It's then supposed to list all the coasters in that park, but as I've
said it simply displays the source code (which starts with a
tag!). The pages up to there work fine, and those do have DOCTYPE
and HTML tags.

I'm using CAB 2.7 and Sting v1.15.

BTW it's very nice to find a 'clever' interactive site like this that
doesn't use any client-side scripting!

Hello Frank,

This becomes mysterious again.....
My Atari dealer Mabn in Rotterdam gave no details (guess he got
no more info) He just said the 060 upgrade doesn't work yet
because some adaptions have to be done in the Mvdi. Prof. Walz
(Author of the prg Music Edit) recently mentions something similar on
the forum on atari-world. He ordered a 060 upgrade for his
Milans but was told he had to wait because there were some
problems to be solved.
On 30-3-2001, also in the atari-world forum (Milan 060 upgrade) 5
customers ask why they have to wait so long for their ordered
060 upgade, but nobody knows....

I wished we would hear something more from Milan themselves
about this.

Cheers
Dan

I followed your directions to the letter, first using IE5/Mac and then CAB on my TT. The site uses frames throughout, but with CAB they're lost on subsequent pages, resorting to single pages. In the Add Coasters page, choosing a park causes CAB to open the link as source code (just as you experienced). But with IE, the code is rendered normally in the main frame on the right. So the problem is that the frames-based structure of the site is lost when using CAB. The server is sending out information to the browser to open the HTML in the main frame, but CAB can't understand the directives.

If access to the site is important, I suggest you e-mail Dan Ackerman to see if he has the time to poke around and see the interaction going on "underneath".

Hi,

What I was thinking about was more like the 16 that I used to have in my
Falcon.

I know that there used to be boards which plugged into the cartidge slot
that upgraded to 16mb but do these still exist?

I hve not seen them for a while!!! (about 5 years or so)

Tim.

Well, *slightly* different results from me! CAB kept the frame
structure, keeping the index in the left hand frame, but
opening the source code in the right hand frame.

Thanks for having a go.

5174. Status report

Newsgroup: comp.sys.atari.st
Date: 2001-04-21 06:09:44 UTC
From: jimd11@mindspring.com
Message-ID: <9br878fmo1@slb6.atl.mindspring.net>
Source record: 47311

System: TT030. NVDI. ICD or HHDriver.

A few days ago, I posted a report, looking for advice, about file damage on a partition that holds programs that do a lot of writing and erasing, such as Newsie, Ghostscript, CAB, and TeX. That has resulted in used clusters not in the FAT (mostly Newsie's old log file) and two files with links to address 0000, which is fatal. Had a ZIP drive backup.

Was booting with ICD Pro. and could use Cleanup to fix most problems, which occurred on a daily basis, with about 1000 file erasures per day.

Changed to HDDriver, which does not let Cleanup run, and then found that Z-org has a FSCK, file system check and repair routine, which will do what cleanup does, faster and quieter, but in French. It is not called fsck, but rather something like Verificatione de la structure. Pardon my French.

In those few days, I have had no write errors to fix, and z-org tells me all is good, I think, in French. (tout va bein?)

Whoever it was complained that Newsie was messing up their partition, some weeks back, should try a different scsi driver system. The clue fairy has not visited me on why this is the way it is, but it does seem to be this way. In other words, do not blame the mousie, or the port settings, unless you are not using ICD to boot your machine. I do like the idea of separate programs to do separate things, but my D partition gets damaged or trashed entirely too often with it.

By the way, I am not bad in statistics, expect this sort of thing to happen once in a while in a perfect world, and this was too often. There is a problem here.

>Yes - don't laugh! A friend of mine really wants to use 1st Word + on a
>Falcon I've just lent him. It's so many years since I've used it that I
>haven't a clue about it any more.

And why not? It's nice and simple to use and will do for most letters,
essays etc. perfectly well. The only thing it falls down on is the
absence of various fonts and inability to justify proportional
fonts. But who needs these for such applications? (I have modified
the 'Light' switch to give me larger text - double size with my
24-pin printer and the largest Times font of my inkjet.

>The only problem seems to be the screen display - the font comes out huge
>and distorted. There's NVDI 5 running. I've tried add Tos compatibility,
>and even disabling NVDI - no effect. Anyone any ideas please?

I have no problems on my Falcon, with MagiC 6 and NVDI 5. Always uses
the (replacement) system font - without NVDI the original system font.
Normal size. Something must be screwing up the VDI. But mine is the
latest version of FWP, 3.20. I believe some older ones had problems
with NVDI. Try and disable NVDI to see if this cures matters - FWP
only uses the system font anyway. If that doesn't work, try removing
all AUTOs and ACCs and reinstalling one by one until the culprit is
localised (*if* it is!). How well does it print?

But you can pad out phrases that are shorter (as usual in English)
with spaces. In some cases you can also move the '[' if used for
underlining in dialogs, and ']' such as end of button text to make
sure it remains centred. When shortening this way you may add an
extra NULL ($00).

>after the Organization: line is written it doesn't do a carriage return
>so the subject line is written right after it. Obviously other peoples
>mailers don't pick up the subject and it ends up with no subject.

You should pop over to Menu, Options, Local, click on the popup labelled
for files and have assign a matching suitable extension, configure here
for formatting and linends and i think your prob may be solved.

What version QED are you using, i had problems with 4.52 with its OLGA
behaviour when using with Newsie, quiting QED , clicking on Save or
using a key-short did not result in Newsie being informed of the file
save hence no mail was sent.

Reference QED, there are a lot of non-fatal resource errors, button
widths incorrect, some translation is incomplete, loads of speelin
mystakes as well.

TT Serial 2 is the fastest: you must have Serial.cpx and Sting.cpx also.

Re-enable STinG: you must have this in the AUTO or there's no hope.

[Unless you use STiK2...in which case disable Sting and both cpx's
before rebooting.]

>The trouble is that the terminal starts up with the report that the
>modem is online (which it isn't).

In this case, make sure the modem is on power. Then simply click DISABLE
and EXIT, then click the Dialer again and click ENABLE then CONNECT.

When the Dialer [or QDialer for StiK2] has finished, click your CAB or
NEWsie or whatever.

Good luck,
Charles.

I normally run my Falcon in 16-color mode unless absolutely necessary, as
256 or more colors is painfully slow. In 16-color mode, Adamas kick's CAB's
image dithering butt, so to speak. The images are nearly as good in
16-colors as they are in 256 colors.

I see. Good to know. So is the full version more stable if you turn
JavaScript off?

One page in particular that I've had problems with is www.calamus.net. For some reason, even with the newest CAB.OVL, CAB just will not even download it, whereas Adamas will. Strange!

>> Anyway, I just wish something new would be done with CAB or HighWire.

If we could coax the powers that be to release the source code for CAB, that'd be a great thing. Especially since they eventually aren't going to make any more money from it.

Let us say that it doesn't crash that often. On my Hades running
freeMiNT/N_AES I can hardly use Adamas more then 5 minutes before it
starts to behave strange. I've seem reports from other people who are
very happy with Adamas but I believe they are in the minority.

Yep, I noticed that too but I haven't reported this to Dan yet.
You can donwload from Calamus.net if you edit the URL a little bit.

e.g.
http://www.calamus.net/files/dl.php?get=SL2000de.zip (original address)-->
http://www.calamus.net/files/SL2000de.zip (edited address)

What I do is hold down [ALT] when I click on the link and drag the link
to the little URL box. Then I open the URL (alt+u) and paste (control+c)
the copied link into the editor field and edit the address. That's all.

Isn't that so that Cab is just too restricted to do much further
development? And if we could convinced all the people involved to
release the Cab source code as freeware who would take the development
on his shoulders? To make it up-to-date lots of works has to be done.
Java-script, CSS-support, etc... This is probably just too much for one
person.

Phil,

I've successfully been able to load Atari Works (.STW, .STD, and .STS) files and use the
export feature to make .RTF files from the .STW files and .CSV (comma seperated files) files
of the .STS and .STD files (you can even do tab deliminted files and DBF - database files).

I'm then able to open the files using Microsoft Word or Excel.

Try the export feature, it actually works quite well. And I've been doing this using the
TOSBOX emulator on my PC.

very true!
but it may be that the source code could be of use to those working on
the HighWire project! It is always nice I hear to reuse code, and although
the programming language is different, good ideas are not.
of course maybe the CAB code is not even commented!

be VERY careful with newsie. I was queueing up some mail
yesterday, and it reported that it could not read the F: partition
(altough I don't know why it was talking about the F: partition, as newsie
is on my G: partition), amy mail is on the H: partitiion) cancelled the
operation, and discovered later that my entire F: partition had been
deleted. Fortunately I had backups, but not recent enough for me
to get away with not having to do some retyping! :-(
I try to keep ALL my partitions only half full to counter this problem
(which I have had before)
very strange.
otherwise, ZeOrg is great.

hello !

You can try one adaptator usb&serial or usb&centronics.

Then try the famous emulator "nostalgia"
Specialy compil for power-pc processor.

Then try to dialog with this stuff, thru your
specific configuration and network !
Try sting or mintnet; nostalgia support mint
installation.

The better is sometime the direct voice.
Dialog between emulator and real atari.

You will find all you need in this newsgroup!

Not a chance that it's online legally. It's still commmercial. I
believe HiSoft is now the owner of the rights to it and It still
costs $50 new.

Actually, I can't find a mention of it on their site now that I look.
What's the deal with AtariWorks?

I use to use newsie before I switched to amail. For some reason newsie
would always leave an orphan sector on my F: partition. Everytime I would
fix the partition, as soon as I run newsie back came the orphan sector.
Weird eh?

It never trashed anything as far as I know. ;-)

Has anyone else used one of those "Head Cleaning Diskette" things usually with special solutions?

I have used it in the past I remember but unfortunately on this occasion it looks as though the drive head has been damaged!

I have a spare grey fronted Epson HD drive from my original Falcon (which was broken by ParcelFarce) which I can put in temporarily. But does anyone know where it is possible to get the black fronted HD diskette drives which are supplied with the C-Lab MkX case upgrade?

Or can the drive be repaired by a skilled technician?

Thanks

Neil :-(

You can't (easily) put RAM on the cartridge port, without modifying the
hardware, as its designed to allow
only data to be read, not written. More than 4Meg on a 68000 (as opposed to
680x0) based machines is also a problem.

A quick browse of my usual sources for ST based hardware only results in
4Meg upgrades, so I think unless you want to
indulge in some fairly advances hacking you are stuck with 4Meg Max. There
is some info on doing 16 at http://atarihacks.cjb.net/
buts its incomplete

Sorry. This is the result of a new directive from the Council of
Ministers (of the EU for non-europeans). All computer screen will be
in French for six months, and will then change in line with the
country holding the Presidency.

Thanks a lot, I appreciate that!

I have received lots of offers of people willing to take over the FAQ. One of them was Martin-Eric Racine who I've seen on this newsgroup for as long as I've been here. He has always been friendly, supportive and helpful, and also has a lot of technical knowledge about the TT and the Stacy that the Quick FAQ was lacking. I'd like to wish him good luck as new maintainer of the FAQ.

I'd like to thank the other candidates, they were all welcome, and proved that there are still a strong community spirit. It was hard to have to make a choice, but there could be only one. I hope there will be no hard feelings.

I'll leave it up to Martin-Eric to keep you updated with the new URL for the Quick FAQ. Hopefully the http://quickfaq.atari.org address will remain active. I'll also be keeping my file archive at http://bales.online.fr/atari/files

Thanks again to everyone for providing a great community for a great machine!

Nick

On a somewhat related topic, I am using STing and Dialler with Cab
2.7. I have found that clicking on DISCONNECT seems to do nothing
- all the modem lights stay on. After a few seconds waiting to
make sure, I click on DISABLE which does hang up the line.

Is this typical? If not, what's wrong?

Possible but unlikely unless you left it in a very log time. It
should only run a few seconds.

>I have a spare grey fronted Epson HD drive from my original Falcon (which
>was broken by ParcelFarce) which I can put in temporarily. But does
>anyone know where it is possible to get the black fronted HD diskette

Sorry, no.

>Or can the drive be repaired by a skilled technician?

Not worth while - you can pick up PC-type HD drives for around 12
quid at shows etc that will work, though may need slight
modification to make them drive 0.

There is very little useful on the system disk that you can't get
elsewhere. The main useful item is the Atari Control Panel, but
there are better PD replacements.

I don't think the vga cable is the same - the Falcon ihas a 19-pin
D-plug where the ST has a 14-pin DIN. But of course yours may have
an adaptor.

The MKX uses a Teac FD-235HF, a very
popular drive. Simply remove the black
fascia and put it on a "standard" FD-235HF
(the black version was not made specifically
for C-LAB, but is nevertheless harder to
come by).

While you're at it, replace the LED with a
blue one. Looks great.

I've seen this too. Guess you use the "plus plus plus ATH" sequence to
disconnect ? You can replace it all by "DTR" if your modem support it.
You need co set the modem up to drop the line when the DTR is on a low
level. It's usually the default setting. Works great here.

Bye,
/Pascal/

True, the emulators seem to be ok (aside from the fact that I can only use
ST graphic modes - not a happy idea to me). However, I have yet to see a way
to access the Mac's filesystem through one of these emulators. This would be
very important if I want to share files between my Falcon and Mac software,
do any kind of web or printer sharing (if that's even possible), etc.

The only emulator I've seen for the Mac that I like at all is MagicMac, and
it's insanely priced, and difficult to get in the US. Now if someone would
make a Falcon emulator for the Mac, then I'd be happy, as it would support
high-resolution high- and true-color modes (hopefully). Mind you I'm coming
from a Nemesized Falcon running in 1024x768 graphics mode. Being chained
down ST modes would be truely frustrating.

All that has happened to me, other than trashing a partition, was that
Newsie requested that I insert a disk in drive A. I think it was ICD
Pro that trashed the partition.

Hi Oliver,

Another assembler package for the Atari ST, is the 404 page book
'Introducing ATARI ST machine code', published by zzSoft by R Pearson
and S Hodgson. It comes complete with a disk having a symbolic
assembler/linker, symbolic disassembler/debugger, resource construction
program and assist progs. together with every example program in the
book. The example programs are easily adapted to the Devpac standard.

It just so happens :)) that I have a copy of book and disk, going for
ï¿½10 +pp. Hope you're in UK.

>680x0) based machines is also a problem.

The CPU isn't the problem, it was Atari making a cheap DRAM controller.
68000 is limited by 24 (well 23 if you don't count UDS) address lines which m
makes 16Mb.

>A quick browse of my usual sources for ST based hardware only resultsin
>4Meg upgrades, so I think unless you want to
>indulge in some fairly advances hacking you are stuck with 4Meg Max. There
>is some info on doing 16 at http://atarihacks.cjb.net/
>buts its incomplete

Memory expansion through a cartridge port would probably be slow as you'd
have to map various address to the limited cartridge port space.

>Is this typical? If not, what's wrong?

No, not on my modem anyway. It's the hangup string that is probably wrong.
When you click disable it is hanging up the modem with hardware, typically
the DTR line. Look at the coniguration for the hangup string and match with
the one in the modem manual. I have ,+++,ATH which works fine.

Ahh OK thanks. I did try fiddling with these but it didn't help. Seems more
like Newsi not sending a carriage return at the end of organization if there
is no value placed there though.

>What version QED are you using, i had problems with 4.52 with its OLGA
>behaviour when using with Newsie, quiting QED , clicking on Save or

Both wrong :) The video is 13 pin, VGA is 15 pin. Floppy is 14 pin IIRC
but thats OT. I only mention it as it's a DIN. Used on some old
Panasonic VCR/camcorders I think.

>
I haven't done business with Woller in a few years, but NAES
arrived promptly
back then. I don't even remember how I paid. Upgrades arrived by
email, and have
always gotten a response from him when I submitted email address
changes.
Same with ASH. I placed an order over their web site, and never
got an response.
A couple of weeks later, a few hundred dollars of software
arrived that I hadn't
even paid for yet. I mailed a money order off, and guess
everything worked fine.
I was allowed to use the BBS to obtain and order upgrades as
well. This has been
a couple of year ago. I'm in the US.

There is also the free Turboassembler by Marcus Fritze. It's in German
however... but maybe there is an English version somewhere.

I just tried to start Turboassembler in parallel with Okami in Geneva and
it did not crash but looked a little strange in TT medium.

You really should walk the Okami way. Believe me it's *the best*. AFAIK,
you can't use Amail to post in newsgroups, you can retrieve news
messages though.

Setting up Okami isn't that difficult. You only must take some time to
read the docs carefully.

Hello Vincent,

This is also the case on my Milan, and I know another Milan user (Robert Best) who has it too. We have tried to solve it two years ago (we got lots of advice from this newsgroup) but without result. Only modem 1 works. We gave up. With Iconnect under Magic Milan the serial 2 is recognized as well with Draconis and Wensuite. On other Milans this problem doesn't seem to occur with Sting, for exemple on Clement Benrabah's (a french Milan user you might know) Milan no problem.
I managed to get Sting recognize serial 2 when I boot from a floppy though, try it. On the floppy disk make an autofolder, cpx folder, Sting folder with all the relevant stuff, install Xcontrol.
A complete mystery.

Cheers
Dan

I suggested a while back that he use black LED's, much more effective in a bright room, works by local wavelength absorbsion, summat like the magic buttons that Sony used to use. Chrome LED's are also very fetching when set against the right background.

|A few days ago, I posted a report, looking for advice, about file
|damage on a partition that holds programs that do a lot of writing
|and erasing, such as Newsie, Ghostscript, CAB, and TeX. That has
|resulted in used clusters not in the FAT (mostly Newsie's old log
|file) and two files with links to address 0000, which is fatal. Had a
|ZIP drive backup.
|
|Was booting with ICD Pro. and could use Cleanup to fix most problems,
|which occurred on a daily basis, with about 1000 file erasures per day.
|
|Changed to HDDriver, which does not let Cleanup run, and then found that
|Z-org has a FSCK, file system check and repair routine, which will do
|what cleanup does, faster and quieter, but in French. It is not called
|fsck, but rather something like Verificatione de la structure. Pardon
|my French.
|
|In those few days, I have had no write errors to fix, and z-org tells me
|all is good, I think, in French. (tout va bein?)
|
|Whoever it was complained that Newsie was messing up their partition,
|some weeks back, should try a different scsi driver system. The clue
|fairy has not visited me on why this is the way it is, but it does seem
|to be this way. In other words, do not blame the mousie, or the
|port settings, unless you are not using ICD to boot your machine. I do
|like the idea of separate programs to do separate things, but my D
|partition gets damaged or trashed entirely too often with it.

I use HDDriver and have always had problems with Newsie mucking up
the partition. I keep the log writes to a minimum, have put Newsie
in a partition of its own, and use Diamond Edge as required to clean
up lost clusters.

I'm not sure what HS means either, but it may simply mean High Speed
on this particular modem. Looking at the modem right now, while
connected back on Modem 2, it's also showing the same two lights, so
perhaps this is normal. It must be how I've set up the Serial 2 port
in that case...

Sure, but this should make no difference when using any terminal
program that understands ports other than the MFP modem port 1.

Still, I'll try changing all my settings to completely match yours and
see what happens. Some of your other differences may be improtant
(although I can't see why)...

Yes, this may be the problem. The bulk of Jeremy's later development
was focused on the CD version. I can't remember the last version, but
it was something like v4.1 or v4.2. I had some of the beta versions of
the final release, which is what I'm using now. I'm not sure if Paul
at FaST Club offers the last version, but ISTR that the betas were
available as upgrades to the final release version from the website.
The final release version of IC4 CD version definitely handles D&D.

That's about a fiver. Whe I came back on the scene a couple of months
ago it was the first thing I registered after I found that MPlayer had
ceased development. It's getting better all the time and it's worth it
to support further work. Luckily I work with a French girl who let me
send a cheque in FF to make it easier for payment.

If you don't then the picture just displays wrongly. It's an issue of the order of the colours in the palette rather than which colours are used overall. I think the key is what exists in the first 16 colours of the pallette. IIRC the Atari has one order, Windows has a different one and the web uses a different pallette again (something like that - if I'm wrong, I don't think I'm too far wrong...)

Yes, as I said in the last version you need the latest CD version.

5260. WTS:WTT: Atari STf for Mac

Newsgroup: comp.sys.atari.st
Date: 2001-04-24 00:39:32 UTC
From: David Smith <david@suscom.net>
Message-ID: <3AE4CB43.F49172EF@suscom.net>
Source record: 47293
Cross-posted to: pa.forsale,pa.wanted,comp.sys.atari.st

I have an Atari 1040STf I would like to sell, or trade for a Macintosh Performa 5400 or 5420. This system includes both a SM124 Monochrome and SC1124 Color Monitor, connected to the 1040 with a PP Monitor Master, allowing for easy monitor switching. In addition to the built in floppy drive, an additional SF314 floppy and Supra 30MB Hard Disk are included. An Alfa Data track ball and Atari two button mouse are included, attached to the 1040 with a PP Mouse Master, mouse and joystick port extender and switch. A pcDitto II board is internally installed in the 1040, providing the ability to run CGA and Hercules graphic compatible DOS programs. In addition to the installed TOS 1.0 ROMs, a set of Rainbow TOS 1.04 ROMs are included, with Utilities disk.

Please make me an offer. Besides the Performa 5400/5420, I will consider trading for any PowerPC based Mac.

5261. Atari 520ST-FM questions...

Newsgroup: comp.sys.atari.st
Date: 2001-04-24 01:37:42 UTC
From: mitch2gs@hotmail.com
Message-ID: <3ae5d8e4.24704185@news.starnetinc.com>
Source record: 47294

Last week, as luck would have it, I came across an Atari ST (520 FM) at a local thrift shop and so grabbed it. Though apart from seeing these on display in stores over a decade ago (and knowing a bit about them from a technical stand point), I have absolutely no experience with the ST line. For that reason I have several questions I'm hoping to find answers to.

I've managed to get the machine working again after a few repairs (floppy drive had a worn out motor belt, which I replaced with an elastic band; mouse was missing its rubber ball which I found a substitute for) and it now boots into a ROM based version of GEM (v1.0) which I have to admit, is a pretty cool concept! Now on to my questions...

- First off, this particular machine appears to have a 360K 3.5 drive capable of reading MS-DOS format. Unfortunately while it can _see_ 720K MS-DOS disks from GEM, it can't access them reliably as the drive only has a single head. I tried formatting 360K single-sided(?) disks from my PC (told the BIOS my 1.44M drive was a 360K 5.25) and the ST did recognized it, but it still wouldn't reliably read from such a disk. So how do I transfer software between my PC and ST? (I also have an Apple IIGS with GCR and MFM drives if that helps)

- I discovered I can plug in a standard 1.44MB PC drive (set to '0') and use that as a 720K drive on the ST, but it doesn't seem able to physically fit in the case. I can't twist the IDC cable around and the eject button becomes blocked once inside the ST's case. At least this let me reliably read MS-DOS 720K formatted disks but it requires taking the whole machine apart to do so.

- Can you add more RAM, or is it fixed to 512K maximum? I did notice solder pads above the two banks of chips (presumably to bring it up to 1MB?) though doubt it'd be a trivial soldering job. This is a Revision D board incidentally.

- What's the "FM" in the name stand for, the built-in floppy drive and RF-modulator? Or does it mean something else?

- Can the ST do special tricks to get more than 4 or 16 colors per screen?

- I recall the ST using an AY-3-8910 for sound but found a Yahama chipset on the mainboard. Is this simply a compatible chip, or something more with FM synthesis? (e.g. YM3812)

- Has anyone tried using an Apple IIGS RGB display on the ST, and if so, does someone out there make the properly wired cable?

- Where can I download software to have a look at (I'd be especially interested in games and European-style demos--can someone point out some must-see titles?). I remember seeing an Atari demo with a reflective 3D ball rolling across some patterns, might be interesting to see that again if I knew what it was called. Is there much software that even runs in 512K RAM with a 360 or 720K floppy drive?

Any other useful information, tips or trivia about the 520ST would be great to hear. :)

ps - Does anyone have spare plastic keycaps to donate? This 520ST came in decent shape, but oddly ten keys and only those ten keys are extremely UV-yellowed (it looks as though someone may have swapped them from another ST). The keys I'm looking for are: 1, 4, 5, Q, W, A, Y, M (plus "5" and "-" from the numeric keypad).

>my questions...

I have TOS 1.02 in my STfm and don't really have that many problems, though
you might want to look at replacing your version with 1.04 as this fomats
floppies with a DOS format as opposed to Ataris slightly different format
that was used with earlier versions. I have not upgraded because my TOS ROM
are soldered onto the PCB but if yours are socketed it will be easier.
Most people on the group will probably recommend adding an upgrade board
that will allow you switch between your existing TOS version and TOS 2.06
(the last ST version), however I don't think you will be able to find room
inside the case for both the TOS and Memory upgrade boards and so if you
decide to do both you may have to consider re-casing the ST.

>- First off, this particular machine appears to have a 360K 3.5 drive

>to physically fit in the case.

You should be able to access a 720K floppy but you will only be able to see
and access the contents of one side, a double sided 720K drive should be the
minimum you are using if you want to guarentee access to most software. The
Quick Faq at http://quickfaq.atari.org/ will probalby have information telli
ng you how to fit a PC drive, alternatively purchase an Atari 720K drive
from one on the dealers listed on the Atari Hyperlink Luanchpad site at
http://www.geocities.com/SiliconValley/Bay/8745/
I would not rely on your rubber band solution very long, infact this might
be part of your reading problem as it may be too loose (or tight) a fit.
You will probably prefere to purchase form a dealer in your own country, but
if you have trouble finding what you need you should be able to get it from
Atari Workshop in the UK at http://www.atari-workshop.co.uk .

>- Can you add more RAM, or is it fixed to 512K maximum

Yes, you will need to fit a third party upgrade board like the Marpet Extra Ram Delux board, this lets you up grade to either 1 or 2.5 MB while still using the existing RAM or 2 and 4MB by disabling the existing RAM, IIRC this is done by removing one resistor.
The problem might be getting hold of the SIMMs that fit in these boards, try the dealers from the links above for both the boards and SIMMs, or asking if someone on this group has one for sale. I happen have two spare 256K SIMMs for this board so that you can expand it to 1MB should you have trouble finding some.
As for fitting difficulty it depends on how the ST was assembled, the Video Shifter chip is usually in a socket so that is not a problem, however if the MMU chip is not in a socket you will have to do a lot of soldering, some of it to the surface mounted MMU itself. This can be tricky even for an experienced solder to solder to without shorting two legs together.

>- What's the "FM" in the name stand for, the built-in floppy drive
>and RF-modulator? Or does it mean something else?

No that it (F=internal Floppy, M=TV Modulator).

>Can the ST do special tricks to get more than 4 or 16 colors
>per screen?

I believe that some art packages and games get around this be palette switching, but generally no.

>- I recall the ST using an AY-3-8910 for sound but found a Yahama
>chipset on the mainboard. Is this simply a compatible chip, or
>something more with FM synthesis? (e.g. YM3812)

IIRC there are at least two Yahama chips in the ST, on as you've mentioned is the combined Sound generator and Floppy controller, another is the Keyboard/Clock and calander. As Atari tended to build using whatever components were cheapest at the time its possible that any other chip could be made by Yahama on your ST and someone else on another.

>- Has anyone tried using an Apple IIGS RGB display on the ST, and
>if so, does someone out there make the properly wired cable?
>- Where can I download software to have a look at.
> Is there much software
>that even runs in 512K RAM with a 360 or 720K floppy drive?
>Any other useful information, tips or trivia about the 520ST would be
>great to hear. :)

If you have permanent access to a TV and the modulator is working you might as will get and arial switcher and use that as you wont find a significant advantage in using a RGB monitor.
As for software, most software written for the ST will work with 512K RAM and a 720K floppy drive as that quickly became the standard configuration for most ST's. Its only software that was written specificaly for hte Mega StT and STe have to watch, some of it will work nad some wonk as it either requires at least 1 MB RAM or makes use of colours the STe's greater colour palette and Blitter chip which was not fitted to early ST's.
You can find links to site with downloadable software for the Hyperlink

Launchpad site I mentioned earlier or do a search for Atari on the web, many users place software for downloading on their personal sites.

>ps - Does anyone have spare plastic keycaps to donate?

Again your best bet is to purchase a replacement set from one of the dealers listed on Halvards sites.

Hope that helps,
Stephen Moss

Hallo Vincent!

CV>Sting 126 don't recognize my serial 2 (uart2) but just modem1 in the
CV>dialer. No prob with connect or wensuite (with magic).

I've got a Milan here, and have had that same problem, too. My solution is to use the very first available version of the HSMODEM drivers for Milan. With these, I can access one of the UART ports with STinG. This is with MagiC-Milan. With MiNT and N.AES, I've got Franks UART drivers installed and could use STinG, but as I've got a working MiNT-Net setup, there's no need to use STinG at all.

In any case the Modem is hooked to Port MODEM2, that's eqivalent to UART 3F8. The second UART port 2F8 is referred to as SERIAL2 and normally not in use. I've got a Nullmodem link to one of my Falcons there, which the STinG Port CPX handles flawlessly.

mit freundlichem Gruï¿½ aus Ahornberg
Ekkehard

The latest official release is on the Chapelie but I think you won't be
able to access the server right now. The server is down for the moment.
The webmaster is working very hard to get the server back online ASAP.

Anyway you should better use the latest beta release (which isn't on the
server). Both the latest official release and the latest beta can be
found on http://www.xs4all.nl/~josdb/okami.html.
Probably it will be better if you download both as the beta release holds
only holds the bins and update.txt

>I was at Gary Preists site

Do you mean POP3SMTP? It's a beta version which lacks lots of stuff. You
better stick to Newswatch/Popwatch.

>In DEFAULT.CFG set SLICE = 200
>Then in your dial script or in Qdialer Set Slice to 10
>This should put stik fairly far on the back burner until you run qdialer.

Yes, this works ok. Until I run qdialer STik doesn't slow down the computer anymore (it slows it afterwards). SLICE=10 seems to be more-less ok, maybe transfer rates are just a tiny bit slower than with optimum STing settings, but it is hard to tell because it varies very much for other reasons (ISP load, etc.).

>Yes and no. You can change the SLICE value dynamically from the
>tools section of Qdialer.

Entry in this field can not be changed for some reason in QDIALER? The value written in configuration file just sits there (I can not set the cursor to the field).

On a similar note, how does one abort dialling in QDIALER? If I hit [escape] while the dialling is in process, QDIALER hangs up, waits until a timeout passes and then starts dialling the next number. Repeatedly hitting [escape] a couple of times can abort the dialling altogether but but then QDIALER starts behaving quite strange, reports "Open device failure" and eventually freezes completely. The reason why I need to abort dialling is that, because of bad (old) telephone network here and pulse-dialling, a telephone number is often mis-dialled in funny ways.

Another question :) If I omit the "conversational" part of the dial script ("Login" and "Password", etc.) relying on PAP protocol, the login negotiation sometimes succeeds and sometimes not. If I enable the conversational part the negotiation always succeeds but, in the window showing connection progress, "Login" and "Password" always appear twice. Is this ok?

Hello

I put on http://www.ifrance.com/preverdy/kg2j/index.htm an alpha version of
a GFA to JAVA converter.
(This is an alpha version, so there are a lot of limitations.)

You can see a converted GFA application to Java applet on
http://preverdy.ifrance.com (applet KIKTRIS) (Beware: I think that Atari
browsers will only display a picture instead of the applet).

Note: any mistranslation report on
http://www.ifrance.com/preverdy/kg2j/index.htm will be helpful.

Thank's

Philippe Reverdy

Yep, the twist is annoying (although you could try extending it and you
either need to modify the drive to take the old Atari faceplate or cut a
hole in the case. Look for The Atari Launchpad as it's useful for
beginners and it has a archive on how to do the above properly.

Yeah. You'll need identical size DRAMs and patience! Also a couple of
resistors need soldering in for RAS/CAS lines. There are schematics out
on the web for the ST but the URL escapes me.

>- What's the "FM" in the name stand for, the built-in floppy drive
>and RF-modulator? Or does it mean something else?

Spot on.

>- Can the ST do special tricks to get more than 4 or 16 colors
>per screen?

Nope, not in TOs anyway. Some graphics viewers take over the screen and
change the palette very quickly to make it look like more colours.
Neochrome and Photochrome come to mind.

>- I recall the ST using an AY-3-8910 for sound but found a Yahama
>chipset on the mainboard. Is this simply a compatible chip, or
>something more with FM synthesis? (e.g. YM3812)

It's a Yamaha chip. 3 channel and pretty crude for it's day. C64 SID
chip is far better IMHO.

>- Has anyone tried using an Apple IIGS RGB display on the ST, and
>if so, does someone out there make the properly wired cable?

The moniot port has RGB out so it should be possible provided you know the
pinouts. In the back of the Atari ST manual.

>- Where can I download software to have a look at (I'd be especially
>interested in games and European-style demos--can someone point

>reflective 3D ball rolling across some patterns, might be interesting
>to see that again if I knew what it was called. Is there much software
>that even runs in 512K RAM with a 360 or 720K floppy drive?

Email/news can be done (just!) That demo is STE only IIRC called Boing.
I don't know of any demos that run on STFMs :(

>Any other useful information, tips or trivia about the 520ST would be

>found on http://www.xs4all.nl/~josdb/okami.html.
>Probably it will be better if you download both as the beta release holds
>only holds the bins and update.txt

I found it there after finding chapelie down. I download the latest non-
beta version. Version 2 IIRC

>>I was at Gary Preists site
>>and I saw a combined POPwatch, is this any good or should I stick to
>>Newswatch and Popwatch.
>
>Do you mean POP3SMTP? It's a beta version which lacks lots of stuff. You
>better stick to Newswatch/Popwatch.

That was what I was thinking about but I've d/l Popwatch and Newswatch. I
went through the o.inf file and edited it for a NOS setup. It runs but it
says onews.def not found (I suppose I have a path wrong) and it says no
news available. I then tried sending myself an email but it crashed
saying no editor found as I clicked Edit. The manual is appaling and only
seems to be aimed at Mint users. It goes on about all the etc/ directorys
and it's rather confusing.

What do I do with Newswatch/Popwatch. Do they run in the background? I
thought you said place them in the auto folder but they're GEM apps so I
think I may have recalled that wrong.

Thanks!

Has anyone put blue, red and green in one LED package? Like the Tri
colour LEDs with 3 pins? That would be great as you could select the
colour and then you could match it with the Magic themes :)

No problems at all with connecting with any version. But
regular crashes followed by a "Speicherblock zersti¿½rt"
warning under Magic Milan.
Let's hope that in the next update the stability problems will
be solved once and for all.

Hello Ekkehard,

I tried this too (2 years ago) but not on MODEM 2, but only on SERIAL 2 as far as I can remember. That didn't work. As soon as my Milan is back from the shop where it is being repaired at the moment I'll have another go and try MODEM 2. Very curious if Vincent gets Sting going now, thanks to your advice.

Cheers

FamilyNet Newsgate

Hello Mitchell!

MS> ...it now boots into a ROM based version of GEM (v1.0)
> which I have to admit, is a pretty cool concept!

I thought so too, no more lost system diskettes! :-)

MS> First off, this particular machine appears to have a
> 360K 3.5 drive capable of reading MS-DOS format.

Sounds possible. I know some early STs used a single sided
double density diskette drive. I guess some STFM may have
had them too.

MS> I tried formatting 360K single-sided(?) disks from my
> PC (told the BIOS my 1.44M drive was a 360K 5.25) and
> the ST did recognized it, but it still wouldn't
> reliably read from such a disk.

PC compatible 5.25" 360Kb disks were usually 40 track
creatures, where 3.25" disks are usually 80 track...

```
PC ST
Tracks: 40 80
Sides: 2 1
Sectors/Track: 9 9
Bytes/Sector: x 512 x 512
----- -----
360K 360K
```

...I'm not sure if this would work, but you could try a
single or double sided 3.5" double density (not high-
density) diskette in your PC and...

FORMAT A:/T:80/N:9/1

...given the choice, I would try to find a double-sided
drive for the STFM.

MS> So how do I transfer software between my PC and ST?

Good question. Even a null-modem cable isn't going to
help if you don't already have some comms software on a
disk that the ST will read. If the above format command
doesn't help, I'm thinking you would need a different
drive for the ST. Perhaps someone in this group knows

where a replacement internal, or additional external drive
can be obtained.

MS> I discovered I can plug in a standard 1.44MB PC drive
> (set to '0') and use that as a 720K drive on the ST,
> but it doesn't seem able to physically fit in the
> case...At east this let me reliably read MS-DOS 720K
> formatted disks...

It may be worth making a cable that will connect between the
ST's external diskette port and the PC drive. I suggest
trying to find a replacement drive, and if that doesn't work
see if you can make a cable.

MS> Can you add more RAM, or is it fixed to 512K maximum?
> I did notice solder pads above the two banks of chips
> (presumably to bring it up to 1MB?) though doubt it'd
> be a trivial soldering job. This is a Revision D board
> incidentally.

I've upgraded some STFM before, but don't remember what kind
of RAM the Rev. D board requires. Were there spaces for
sixteen chips, or four? I'm comfortable soldering multi-
layer PCBs, and I seem to remember it was pretty straight-
forward.

MS> What's the "FM" in the name stand for, the built-in
> floppy drive and RF-modulator?

Yes.

MS> Can the ST do special tricks to get more than 4 or 16
> colors per screen?

I remember some software hacks that seemed to display more
than 16 colours per screen. Spectrum 512 was a paint program
I think that could do this, and I've seen a few utilities
that could display files of this format. I did my first ray
-tracing on an STFM, and converted the true colour files
into Spectrum or perhaps NeoChrome format for display.

MS> Any other useful information, tips or trivia about the
> 520ST would be great to hear. :)

If you get the opportunity, pick up a high-res monochrome
monitor (SM124/SM125), especially if you intend to do any
word-processing or just want to see GEM at its best.

Good luck,
- Andy.

Adding a PC style 1.44Meg floppy drive was a popular modification for early STs. There were however, as you've noted, several problems.

The original Epson floppy drives usually had the ribbon cable connector upside down from the more common Teac style PC drives so the cable has to be reversed somehow. And as you also noted, Atari used a custom faceplate for the drives making it difficult to install a normal floppy drive. Careful work with a hacksaw is usually in order.

Another problem you probably haven't run into yet, but which you probably will, is that the "media change line" is treated differently

with the PC drives than it is with the Atari Epson brand floppys.

When you remove a floppy and insert a different one, the OS is supposed to be notified via the "media change line" so it forces a re-read of the directory from the new disk. With the PC floppy drives, this doesn't happen (or happen reliably), so the OS doesn't know there is a new disk in the drive. This can be catastrophic if you try to write to the new disk because the OS still has the directory from the old disk cached in memory and will write to the new disk with the old directory. This will destroy the contents of the second disk. There are hardware fixes for this for some of the common PC style drives. You can also force an update of the directory manually by pressing the ESC key when the directory window is open to that drive.

There should be text files floating around giving details on how to transplant a PC style floppy drive into an early ST if you can find a good archive site. (There used to be a great one at umich.edu, but I understand they've closed their FTP site. It may still be available by http, but I don't know where to start looking.)

As long as you format the floppy disks on the PC, you should avoid the problems of compatibility another reply alluded to.

Early versions of the TOS operating system had some bugs in the format routines which did not create a fully MS-DOS compatible header on floppy disks. However, disks formatted on a PC as 720K should be readable on the Atari (as long as you have a double sided drive in the Atari that is).

>- Can you add more RAM, or is it fixed to 512K maximum? I did
>notice solder pads above the two banks of chips (presumably to
>bring it up to 1MB?) though doubt it'd be a trivial soldering job.
>This is a Revision D board incidentally.
>

This is a very common problem with STs. Atari tried to force customers to "upgrade" by throwing away their old machines and buying new ones with more memory (a little like early Macs). Your 520STFM has an early revision board, before they actually redesigned the PC boards to prevent users from doing their own memory upgrades. At that point, the 520STFM shared the same motherboard with the 1040STFM, which was a 1Meg RAM unit. You CAN upgrade your motherboard by removing all the solder from the empty row of socket positions and soldering in another row of RAM chips. It's a pain and it can be tricky unless you're really good with a solder sucker and solder wick, but it can be done. Again, there are text files which give all the gory details (there are three resistors which need to be added in addition the RAM chips and preferably sockets for the RAM as well). The advantage of doing it this way is the upgrade is rock-solid (being soldered right to the motherboard). The disadvantage other than the painstaking work involved, is that 1 Meg is the most you can expand

to.

Third party manufacturers soon came up with ways around Atari's greed, allowing users to add memory, but these can be described most charitably as pretty god-awful kludges.

To add one of these memory upgrades you first must locate enough room inside the case for the memory board itself. Then there is a major connection kludge needed to the MMU chip, and a minor group of connections needed to the video shifter chip. Finally you need to run power to the board directly from the power supply.

The first one of these I installed provided two DIP headers which you were supposed to press down on top of two existing DIP ICs on the motherboard to make the MMU address and data connections, and tie them in place with the sting and double-sticky tape provided in the kit. That worked for about 10 minutes. I finally ended up soldering the DIP headers to the ICs, holding my breath the entire time. It ended up working, mostly.

The second upgrade, and the most reliable I've seen, used a small "daughterboard" PC board which soldered onto the BOTTOM of the motherboard, right onto the bottom of the MMU chip. That provided a very reliable connection. Then there was a ribbon cable from the daughterboard up to the memory board, then another ribbon cable to a second daughterboard that fit into the video shifter socket, with the video shifter socketed onto the second daughterboard.

The advantage of doing an upgrade this way is that you can expand up to the maximum limit of 4 Megs, and most of the newer boards use 30pin SIMMs instead of individual memory DIP chips.

The disadvantage of course is having to pretend to be Tom Swift Jr. and his Wacky Memory Robot.

(Incidentally, the 4Meg limit is enforced by limitations in the hardware. The Atari MMU chip doesn't have enough memory address lines to go higher than 4 Megabytes. And Atari folks like to snicker about the "640K limit" in DOS.)

>- What's the "FM" in the name stand for, the built-in floppy drive
>and RF-modulator? Or does it mean something else?

You got it, and that's it.

Incidentally, the 520 in the model number means it has 512K of RAM. Atari was involved in marketing wars with Commodore and Apple, and naturally 520 is better than 512.
>
>- Can the ST do special tricks to get more than 4 or 16 colors
>per screen?
>

Yes. By using horizontal interrupts to change the color palette
several times per scan line, the ST can actually display up to 512
colors per screen. Unfortunately it takes so much CPU horsepower to
do that you don't have much left over to do anything other than
displaying the screen.

While not much by current standards, in its day though, this was
pretty impressive. Look for something called "Spectrum 512" to
illustrate this.

>- I recall the ST using an AY-3-8910 for sound but found a Yahama
>chipset on the mainboard. Is this simply a compatible chip, or
>something more with FM synthesis? (e.g. YM3812)
>
Nope. Three channels of tone generator is all you get. Monophonic.

For better sound you've got the MIDI port to connect to external
devices.

The Atari STE introduced a stereo output that no one used for much,
and there was a third-party addin board (the "Tweetyboard") that would
separate out the three normal channels to give you "stereo" output
from earlier models. Again, no one used this for much.

>- Has anyone tried using an Apple IIGS RGB display on the ST, and
>if so, does someone out there make the properly wired cable?
>
I don't remember anyone using this particular monitor with an ST, but
if you can get ANY monitor working with your ST it will be FAR, FAR
better than using the RF modulator with a TV set.

RF output is only really suited for low-resolution games, and even
that's being overly charitable. You don't ever want to try reading 80
column text on a TV screen. It will make you go blind.

Also, you need a separate monochrome monitor to get the ST to even go
into high resolution mode. Back when the ST was first engineered,
color displays simply weren't good enough, so they gave you the choice
of "not too bad" color, or "excellent, extremely good" monochrome.
It all depends on the applications you intended to run. Most hardcore
Atari owners eventually ended up buying both monitors, along with
third-party switchboxes to switch back and forth.

Yes, it's possible to use SOME PC style monitors with the ST, but it's
something I never tried to do. Again, there are text files about it.

>- Where can I download software to have a look at (I'd be especially

>that even runs in 512K RAM with a 360 or 720K floppy drive?
>

That would be the "Boink" series of demos. It originated on the Amiga, and someone naturally had to write it for the ST to show that Atari could do it too. They got better with time.

Again, I wish I could remember the URLs for the archive sites, but a quick Google search should turn up plenty of underground Atari activity on the web. There are still a lot of diehards in the world.

As for applications, Atari people soon learned that laughing at DOS folks who always seemed to need more RAM in their machines would come home to haunt them, once their applications moved out of the cutesy "boink demo" stage. As applications got more intricate, so did their memory needs. 512K is usable for the crudest applications. 1Meg quickly became the standard, rapidly followed by 2 and 4 Megs.

As a game machine, 1 Meg should suffice, but for more "serious" applications like desktop publishing or music recording, 4 Megs is needed. Of course there are other things that will run in 1 Meg, but don't expect all the bells and whistles.

>Any other useful information, tips or trivia about the 520ST would be
>great to hear. :)
>
Trivia... oy - not enough time for that..! (You won't know who Dave Small is, but there was the time he and I and some other folks from the Michigan Atari group WAUG were driving around Windsor, Ontario (Canada) in the middle of the night looking for a beer store that was still open... oh... Dave Small is a certifiable wizard who invented some things Thomas Edison would have been proud of. He was the one who made Atari STs think they were Macintoshes, just for starters... :)

>ps - Does anyone have spare plastic keycaps to donate? This 520ST
>came in decent shape, but oddly ten keys and only those ten keys are
>extremely UV-yellowed (it looks as though someone may have swapped
>them from another ST). The keys I'm looking for are: 1, 4, 5, Q, W, A,
>Y, M (plus "5" and "-" from the numeric keypad).

If you decide you're serious about checking out the odd little Atari world, hang around in this newsgroup and watch for people unloading their hardware. Many times it can even be "free for the picking up" depending on what area of the country you live in.

Another useful thing is to watch the "vintage computer" areas on Ebay. You can pick up Atari disk drives, hard drives and actual Atari monitors for peanuts. (Often the cost of shipping is more than the cost of the hardware.)

Good luck!

>Panasonic VCR/camcorders I think.

No - only one wrong! The monitor outlet on the Falcon *is* 19-pin.
There is a lead from this that goes to the 15-pin VGA connector of
the monitor. Agree that the ST's video out is 13, not 14-pin DIN.

Message-ID: <3ae5c743.0@energise.enta.net>
Source record: 47212

I tried several versions of Wensuite and they all crashed soon after I started the program. No-one else seems to report this major problem so I would be glad of any suggestions.

Adamas works ok but recent versions will not make a connection to my isp without crashing my Milan completely. I haven't been able to do anything with the mail package.

Answers on a postcard to...

For the moment I am perservering with CAB while waiting for any news on Highwire.

Regards,

Peter

Hi Vincent,

I have Modem 1 and MODEM2 in the Miscellaneous section of the Sting
dialer and that is all, I don't know why the latter is in upper-case.
I use MODEM 2.

Possible areas to investigate are the versions of HS Modem, UART2F8
and UART3F8 found in your Auto folder and the Milan Serial CPX. I
don't think that the Sting CPX settings matter.

Wensuite just crashes on my Mint powered Milan.

5289. colour printing to Epson 850C with Calamus

Newsgroup: comp.sys.atari.st
Date: 2001-04-24 22:05:41 UTC
From: rking@zetnet.co.uk
Message-ID: <3ae5f8b5$0$21934@news.zetnet.co.uk>
Source record: 47224

Hi all,

I'm trying to find the best way to print in colour to my 850C from calamus. Even with the Epson drivers and the rasters I've used so far, the results on a test CDK including the RGBFUJI.JPG and the COL_KEY.CDK have been very crude. The raster rosettes being unacceptably large, larger than with DA'S LAYOUTTC and much much larger than with the PC version of Calamus. I have been told with some authority that the drivers for the Atari version of calamus are just not up to the Windows built in ones, and as far as the NVDI drivers are concerned, I've loaded down the trial Calamus 2000 with the VDI driver and NVDI then gives a very crude error diffusion print and then only on very small CDKs, otherwise giving me an out of memory error with an empty 60Meg spool. Can anyone show me that the Atari Calamus is not useless for colour printing at home.

Thanks in advanced,

Frustrated Bob from Wales

It's probably the cooling fan in the case (bearings
worn out, very common) rather than the drive,
but without a more precise description hard to tell.

I had a Yamaha breifly, it seem to do something similar, I think
it was the CD's spinning. Some are maybe just slightly miss-balanced.
Uneven printing and/or labels can cause extra noise at high rate of
of speed. At least I hope that is all it is.

Hi Edward and Steve

I've found that QED sometimes coughs a bit under Newsie. My solution?
Press Save and Quit in Newsie. It seems that the problems only creeps
up, if I keep Newsie in memory.

5305. [web] The Atari ST QuickFAQ

Newsgroup: comp.sys.atari.st
Date: 2001-04-25 14:09:51 UTC
From: Martin-Éric Racine <q-funk@funkyware.atari.org>
Message-ID: <Pine.LNX.4.21.0104251644360.24689-100000@hal.pp.fishpool.fi>
Source record: 47241

As announced a few days ago by its former author and maintainer, Nicholas Bales, I have now taken over this classic document's daily authoring and maintenance.

The new URL goes as follow:

http://quickfaq.atari.org/
http://funkyware.atari.org/
http://members.tripod.com/~TT030/

From that starting point, there are EU and US mirrors. However, PLEASE DO NOT LINK DIRECTLY TO EITHER OF THOSE MIRRORS from your online bookmarks, as the location of both are entirely dependant upon whatever is my current ISP; only Tripod is permanent.

I have already uploaded an improved version of the QuickFAQ and am currently in the process of reviewing all links found in the document. At this point, the main changes are:

* cleaned up HTML, upgraded to XHTML conformance, with CSS.
* some details on TT and Falcon TOS versions.
* new maintainer name.

Over the next few days, additions will include:

* Stacy Language disks (once I remember where I put them).
* Falcon language disks (once I remember where I put them).
* general restructuring to allow for easier inclusion of new hardware-specific material on the Stacy, ST Book, MEGA, TT, Falcon, clones and emulators.
* automated mirroring of the US site from the EU source site (currently, only the EU site is auto-mirrored from my source documents on the TT; because the US provider only offers FTP access, I cannot use UNIX tools to streamline the process there)

In closing, I would like to thank Nick for the fantastic job he has already done maintaining this document until today and for his trust in my abilities to maintain his legacy in the future. Hopefully, wherever his new computing horizons take him, he will still find interresting challenges and a stimulating life.

I'm glad you asked.

XHTML is a rewrite of HTML 4.01 that conforms to XML rigor, but
retains backwards compatibility. CSS is an optional extension
that describes presentational aspects independantly from tagging.

Because of this (plus the fact that I use CAB as my browser for
web design), it will still work on an ordinary Atari.

On a browser that supports CSS, the QuickFAQ (and my own personal
website) appears in Technicolor and offers a clearer document
structure than ordinary HTML tags could ever offer.

I put on http://www.ifrance.com/preverdy/kg2j/index.htm an alpha version of a GFA to JAVA converter. (This is an alpha version, so there are a lot of limitations.)

You can see a converted GFA application to Java applet on http://preverdy.ifrance.com (applet KIKTRIS) (Beware: I think that Atari browsers will only display a picture instead of the applet).

Note: any mistranslation report on http://www.ifrance.com/preverdy/kg2j/index.htm will be helpful.

Thank's

Philippe Reverdy

Mine's noisy too. Get quite a rumble & sometimes hear it in another
room. Doesn't seem be a problem, but it is a nuisance when it happens.

5314. Newsie CRASH

Newsgroup: comp.sys.atari.st
Date: 2001-04-25 21:16:01 UTC
From: cstanley@zetnet.co.uk
Message-ID: <3ae73e91$0$21936@news.zetnet.co.uk>
Source record: 47100

After an online crash (for whatever reason), I have great difficulty in getting Newsie to quit (on a TT, MagiC6, NVDI5). No amount of clicking Quit or pressing ^Q will do it. I can go away and make a coffee before there is any result. What gives?

Charles.

5315. Newsie: Killfile

Newsgroup: comp.sys.atari.st

From: cstanley@zetnet.co.uk
Message-ID: <3ae73e92$0$21936@news.zetnet.co.uk>
Source record: 47101

Despite my insertions into the killfile, I still get spam from those who claim to be at hotmail. I have killfiled all @ "hotmail.com", but still get spam. I have forwarded stuff to abuse@hotmail, but it claims the originaters are not on their isp. Newsie's killfile works for diversion to specific mbx's. Why does it not kill these spammers?

Help, please,
Charles.

No solution I'm afraid but I have a similar problem (vanilla TOS,
Newsie 0.96). If the mail or news server isn't responding or the line
drops while reading news, Newsie then won't quit.

This is a typical characteristic of the fan
in the SCSI casing starting to fail. It's like
a terrible grinding noise, right? That's
not the SCSI device itself. There's
nothing inside a CD transport mechanism
to make a loud noise without affecting
its performance.

5326. lack of cable

Newsgroup: comp.sys.atari.st
Date: 2001-04-25 23:24:11 UTC
From: infinite <infinite@online.no>
Message-ID: <I2JF6.407$Ty6.8000@news1.oke.nextra.no>
Source record: 47112

I think I may have lost my atari2tv rf cable last time i moved. So now I have to make one (I can't buy one because I barely have enough cash to stay alive). So what's the story about this cable anyway? The RF connector on my STFM looks like a phono-lead connector, while the TV naturally has a standard RF in.

Why didn't Atari use a standard RF out connector? And what am I supposed to do to replace the cable?

(I can't make a SCART-interface lead because I don't know how to attach a resistor to a lead (not much of a hardware-guy I'm afraid)).

Thank you.

Hi Edward

>I have a Yamaha CDRW drive. Now and then it gets real noisy. I thought
>it was my hard drive. Most of the time it is quiet.

Is it noisey when its /not/ got a CD in it, if so its probably the PSU
cooling fan.

If the noise is only during CD access and also maybe varying in pitch,
(depending on the region of the CD its accessing at a given time) you
could well have a faulty spindle motor. This may not be affecting access
at this time due to device caching, but it will give the unit a hard
time and will get worse until it dies.

Spindle speed varies as the tracking diameter varies, hence the possible
variation in pitch i mentioned.

Hey folks!

To take up the slack that's going to be created when Delphi drops text access this coming Tuesday.

Some of us have been chatting on Delphi on Tuesday evenings for quite some time. I myself have been a member of the Atari Advantage Forum for more years than I care to count.

Now Delphi has decided that, for various reasons, it will no longer supply text-based services. The reasons for this are understandable, but it still means that Atari users will be unable to take advantage of most of what Delphi has to offer.

Okay, let me cut to the chase.... If you'd like to chat with other Atari users, fire up whatever telnet application you prefer (yes, you need telnet, not a browser) and point it to:

www.atarinews.org.

Use "bbs" for both the login and password.

If you haven't done it already, type "new" at the userid prompt and pick yourself out a spiffy userid and password.

Please note that you'll still need to login as bbs even though you've now got a userid.

Once you've picked out a userid and password, you can use it to enter into the bbs system. Once you're "in", hit <Return>.

From the main BBS menu simply type the letter "T" and then the letter "C". You will then be magically transported to the main chatroom.

There's no JAVA, no fancy graphics, and no banner ads. Just like old times. Like my favorite bumper sticker says: "Retro is back"! <grin>

We at A-ONE sincerely hope that you will join us in this "old-style" chat no matter what computer you happen to be using.

Questions can be directed to me at the email address listed below.

Hope to see you there,

Joe

Same here (TOS 4.04/Falcon) but it only started relatively recently
and only when sending mail but random. This makes me think that
"improvements" to ISP's software is makeing Newsie more incompatable!
Another guess might be the configuration of whatever is being used to
get on-line (uneducated guesses).

As the subject says, here's what I have:

. Omnitrend's Universe II
. Sierra Codename: Iceman
. Sierra Man Hunter 2: San Francisco
. TimeWorks Data Manager ST

If you're interested in any of the above, please send me e-mail with a trade list or offer (no reasonable offer refused - I need to clean out my room! :) I wouldn't mind trading for other Atari ST games (especially Xenon or Weird Dreams)

Thanks!

Joe

Hello!

I> I think I may have lost my atari2tv rf cable last time i moved.
> So now I have to make one (I can't buy one because I barely have
> enough cash to stay alive)...

I can relate to that.

I> So what's the story about this cable anyway? The RF connector on
> my STFM looks like a phono-lead connector, while the TV naturally
> has a standard RF in.
>
> Why didn't Atari use a standard RF out connector?

Most off-the-shelf modulators of the day came with a phono ('RCA')
connector. Probably because of this, most home computer video cables
came with a phono plug at one end, and whatever the local RF connector
was on the other. Atari were probably inclined to 'go with the flow'
if inexpensive RF cables were already available with appropriate
connectors (I imagine Atari bought these, rather than making them).

I> And what am I supposed to do to replace the cable?

I was faced with this dilemma when I brought some video gear to the
US, where the RF connectors appear to be F type (threaded, so it takes
longer to install stuff, but they're less likely to just fall out ;o)
I spotted a small phono-female F adaptor in a local store, which meant
I could use the same type of cable we had laying around for VCRs,
cable boxes etc.

I> (I can't make a SCART-interface lead because I don't know how to
> attach a resistor to a lead (not much of a hardware-guy I'm
> afraid)).

SCART covers a few different schemes, and you would need to know what
was supported by your TV. I've found some cheaper gear that only had
composite video and mono audio inputs, and that would effect the
correct wiring for your cable. Even composite is far preferrable to an
RF lead for normal use though, you'll get a much better picture. I
left all my SCART connectors in Britain (they're not used over here),
but perhaps someone in the group might be able to make one up for you
(in the interests of maximising your Atari experience ;o)

Umm... what was the resistor for?

Regards,
- Andy.

5345. Re: colour printing to Epson 850C with Cala

Newsgroup: comp.sys.atari.st
Date: 2001-04-26 12:00:58 UTC
From: Bob King <robert.king@patent.gov.uk>
Message-ID: <3AE80DFA.70FDA5BA@patent.gov.uk>
Source record: 47122

Hi Edward,

Only 20meg, working (one bank faulty). It's the quality of the printed rasters, that I'm grumbling about. It's impossible not to compare the 'photorealistic' output of Windows driven printers with the same 720x720 dpi as the Epson 850C, however 'lowly' the programme, with that from Calamus, the premier DTP programme for the Atari platform, and find the latter very much inferior. I know nothing about printer drivers, but I would guess that they transfer the program and graphic image code into those the printer can understand, eg ESC-2, and it is the job of the computer to be ready with the next instruction for the next print dot when the printer requires it. If it's just a matter of even the Milan not being fast enough for Calamus to rasterise the image RGB data to feed the printer driver for a decently fine screen, then lets admit the Atari's not up to the colour printing work of the PC and Mac. It's nothing to be ashamed of, after all a 68040 is a very very slow beast compared to the CPUs of even a medium grade PC or Mac. I also realise that the 'photocopy' embodied in the Windows drivers, produce a Floyd-Steinberg error diffusion raster, but this is the same kind of raster produced by NVDI and this, from what I have seen of the demo and lite version of Calamus 2000, produces a very course dither and with some unacceptable stripe artifacts. The manual for Calamus 2000 says that NVDI has its limitations and that a TC A4 page requires a free spool of 150Megs. That's why I can't print anything of any size from NVDI.
All I want is to be able to print photo realistic colour images for CD covers from my Milan, just like hundreds of thousands of PC and Mac owners do without any thought for how they manage it. If I can't, then it's a change of platform, regretful, but required.

Bob.

You really should use the latest beta version as it is much
better then the latest official version. For instance the setup
of the non-beta version must still be done externally by means of
an editor. However with the latest beta one can change the setup
from inside Okami.
>

True, the very first Okami versions were more intended for
MiNT-users but nowadays everyone, regardless the OS they are
using (except Geneva) can use Okami.
Just take a close look at the o.inf and edit the paths.
>

>What do I do with Newswatch/Popwatch. Do they run in the background? I

DON'T PLACE THEN IN THE AUTO DIR. Both Popwatch and Newswatch
must be run from desktop. You can launch both one by one but
there exist a prg which automate a few things. Get Spawner.prg
from Gary Priest's webpage.

> I spotted a small phono-female F adaptor in a local store, which meant
> I could use the same type of cable we had laying around for VCRs,
> cable boxes etc.

That's a whole lot of luck - I've never seen such adaptors in any stores here in Oslo. But if it's just the plug itself that's physically different, would it work just connecting a standard co-ax cable to the ST-phono with some random pieces of metal, wire etc. ? (I'm really on thin ice here, as I don't know the details of either the co-ax or the phono).

> SCART covers a few different schemes, and you would need to know what

Well what about an amiga 1084-monitor? Surely it must have RGB.. ?

> Umm... what was the resistor for?

I read in a DIY scart-scheme that if you don't apply 150ohm resistors to the scart lead, the TV screen will "burn" because of ataris stronger-than-average signal. Or something like that.

God, my heart aches. Haven't used my atari in 8 months.

Yeah, OK but the docs got right over my head, well most of them. I found
it easier to go through the o.inf and read the bits there. I did do it in
the end but the first time I left the bit that said "advanced users only"
alone, but this section was just as important to edit as the rest!

> Anyway I'll send you via PM a o.inf example

Thankyou.

> True, the very first Okami versions were more intended for
> MiNT-users but nowadays everyone, regardless the OS they are
> using (except Geneva) can use Okami.
> Just take a close look at the o.inf and edit the paths.

OK that worked (and called up QED fine) and I saved and exited QED then I
clicke on the Send button. But nothing is appearing in the spool/mqueue
and so Popwatch doesn't have anything to send. I suppose it works this
way?

>>What do I do with Newswatch/Popwatch. Do they run in the background? I
>>thought you said place them in the auto folder but they're GEM apps so I
>>think I may have recalled that wrong.
>
> DON'T PLACE THEN IN THE AUTO DIR. Both Popwatch and Newswatch

I understand, a sort of batch/scripter program. I might try scripter
later, but I'll try it with spawner first as it's specifically for that
job.

Thanks Martin!

BTW, clicking on Appline to switch task to it, crashs it. Many this was
fixed in the beta, only one way to find out I suppose....

5354. HEX<>DEC converter

Newsgroup: comp.sys.atari.st

From: bindon@madasafish.com
Message-ID: <tegpgb22po3iad@corp.supernews.com>
Source record: 47138

Hi

Anyone know of a hex to decimal converter that possibly also shows the status of each bit. (1 or 0).

I remeber using one that may have been an example for ST Basic but can't find it. Didn't one of the calculator apps do this?

Thanks.

After you've pushed the send buttom the message is still in
Okami and can still be edited. Very useful sometimes. The send
messages are listed in the Outbound.
To make the message ready for uploading you must export then.
You've two possibilities to do that.
1) Run export from inside Okami. Key F7
2) Run oexport.ttp. If you use this you must close okami first
otherwise the onews.def will display wrong figures.

>I understand, a sort of batch/scripter program. I might try scripter
>later, but I'll try it with spawner first as it's specifically for that
>job.

I don't think you'll be able to use scripter cause Popwatch and
Newswatch aren't scripter aware. It's a pity Gary seems to have
abandon the devopement of Popwatch/Newswatch. There are some
problems with both.
>
>BTW, clicking on Appline to switch task to it, crashs it. Many this was
>fixed in the beta, only one way to find out I suppose....

Don't know. On the Hades I use FreemiNT and taskbar. The latest
demo surely doesn't crash on the Mac using magiCMac 6 and
appline.
I only know one program which cause problem with Okami and that
is Freedom 2.05 fileselector. If you use this Fileselector
please don't let Okami import messages at startup. This cause a
severe system crash on my machine. Use oimport.ttp instead.
It's possible this doesn't occur with MagiC though.

I have an 8824E drive that is a replacement for one that
failed shortly after I got it.

The new drive makes a high-pitched whine all the time,
even when there is no CD in the mechanism.

It is not loud but it can be annoying. I agree with the
suggestion that it is probably the cooling fan but I
am now wondering how to silence it.

5360. Aniplay sound repeat problems

Newsgroup: comp.sys.atari.st
Date: 2001-04-26 21:24:50 UTC
From: osian@zetnet.co.uk
Message-ID: <3ae89222$0$21936@news.zetnet.co.uk>
Source record: 47146

I can't get Aniplay to play MP3's properly, the sound keeps repeating. From the help files, it appears that this can happen with movies when the frame rate is too slow, however MP3's are audio only! And in any case, I've ticked the Sound Only option. I can understand a humble Atari not being able to decompress MPEG's in real time, but are MP3's so complicated too? Is there any option in Aniplay that will allow MP3's to be played?

I have converted an MP3 file to a WAV file (by using the Save option, and it took an hour) and it plays that fine. Although it doesn't seem to be in stereo. Are WAVs mono only? Or perhaps the original MP3 wasn't stereo.

If, when this happens, you set STing inactive, using STING.CPX, Newsie
can be persuaded to quit after several retries- most of the times.

5362. Waking up a stored STE

I've had an ST or two in storage now for nearly 6 years and wanted to know if it will revive. I have hooked up an STE to a monochrome ST monitor and the power light comes on but the drive is silent and no life on the screen. These have been stored outside in a building and exposed to the heat and cold of the intervening years. I guess I will take it apart and reseat the chips and see what happens. Where would I send it if I can't get it to work?

Anyone,
I may be purchasing an original atari FALCON from Europe. They run on 220 volts over there. My question is does the FALCON have a switchable power supply like the MEGA STe or is it a manual switch inside the case or on the outside of the case?????? Or will a whole new powersupply be needed for the falcon before it can run here in the USA?????

Thanks you can e-mail me at firest@williams-net.com

Hello,

First, you could have a look at the big capacitor in the PSU : it
is likely to be ï¿½dryï¿½ (sorry, I don't know the english term, so I
translate directly from french...). It happened in 3 STs that
hadn't been used for many months.

Good luck,

J.-Luc

I downloaded Nima's demo to check out the scanner's operation. The scanner works fine, but as the save function is disabled I don't know if it actually will function.

As this scanner is a greyscale only scanner, and will see very limited use as a spare on a spare system, I don't want to pay for that nice of a piece of software if there are other workable solutions. I've got better places for my disposable income at the moment. <G>

However, if his is the only option, that is what I'll have to do.

>Bob.

Do not want to argue, since I have not tried to do what you want to do.

But that printer is a line printer. The application composes a line
and when the printer is ready, it sends it. Your problem is not a
clock speed problem.

Your problem may be a NVDI problem. It cannot handle the resolution
Calamus is capable of. Must you print through NVDI? Calamus can
print directly, and can, I believe, print to a print spooler program.

And, Calamus comes with a bunch of tools I have never used, and
one of them is dither. As I read your tale of woe, you have never

tried, or seen tried, printing directly from Calamus.

I have a registered copy of GemSpool, which would be necessary due
to the size of the files you want to spool. If you go this way,
be sure to save a separate copy of the spooled file, just in case
something goes wrong. That is not the fastest solution, but
it is a work-around for out-of memory errors.

I would suggest taking your file to a full version of Calamus, and
seeing what you can do with it.
